A person is working on a laptop in a bright, modern office setting. The laptop screen displays code. On the desk in front of them is a white, dome-shaped robot with various sensors and components. The person is using a digital depth gauge to measure a component of the robot. Other items on the desk include a screwdriver, a green tool, and a black wheel.

Network introduction

#1.1

LoRaWAN network

LoRa : a story starting in Grenoble, France

May 2015 : Orange LoRa pilot is starting

July 2016 : commercial offer is launched in France, for a global coverage

Dec 2024 : Bouygues Objenious network end-of-life

Orange network guaranteed at least until end of 2027

LoRa : introduction

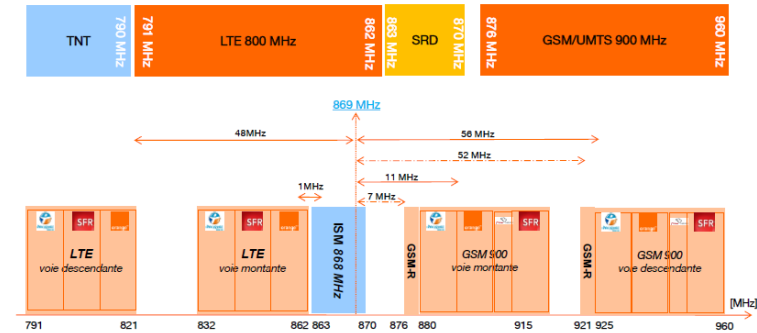

- LoRa® (*Long Range*) : wireless radio frequency technology
- LoRaWAN® : Low Power Wide Area Network protocol specification based on LoRa® dedicated to the Internet of Things (IoT)
- Allows devices to send data to an IoT platform so that customers can manage them (via business applications)
- Very short frames, only **a few tens of bytes**
- Bi-directional network (but **mainly Uplink**), **asynchronous**, and without acknowledgement by default
- Range : up to 15 km (rural environment)

Application				
LoRa® MAC				
MAC options				
Class A (Baseline)	Class B (Baseline)	Class C (Continuous)		
LoRa® Modulation				
Regional ISM band				
EU 868	EU 433	US 915	AS 430	—

LoRa : introduction

- **Unlicensed Frequency, around 868 MHz in Europe / around 915 MHz in the US**
- **EU: Duty cycle to enforce (max 36 seconds of emission per hour per sub-band/device) + max 25mW of emission power ; 6min and 500mW for gateways**
USA: Emission power limited by FCC
- **Low Power: devices only send a few messages per day**
- **Battery life duration estimation : up to 10 years**
- **Sensitivity down to -138 dBm**
- **Mainly 2 types of devices:**
 - Class A: battery powered, listens to messages from the Network only when it sends an uplink message
 - Class C : external power supply, listens almost permanently to messages from the Network

868 MHz ISM band used by LoRa networks in Europe

➔ The ISM 868 MHz band used by LoRa networks is 1MHz from LTE 800 Orange uplink and 11MHz from 2G/3G 900 BYT uplink band

+ 148 autres membres

SF : Spreading Factor

ADR : Adaptive Data Rate

SF impacts

- Range
- Indoor penetration
- Throughput
- Payload size
- Power consumption
- Network capacity

Adaptive Data Rate (ADR) scheme is used by the LoRa network infrastructure to manage the data rate, number of transmissions and RF output power for each end-device individually. The goal is to maximize both battery life of the end-devices and overall network capacity.

SF : Spreading Factor

Data Rate	Modulation (EU)	SF	BW	bit/s	SNR (SoC SX1272/73)	Sensitivity (SoC SX1272/73)	Max payload size (North America)	Max payload size (Europe)
0	LoRa	12	125	250	-20 dB	-137 dBm		51 bytes
1	LoRa	11	125	440	-17,5 dB	-135 dBm		51 bytes
2	LoRa	10	125	980	-15 dB	-133 dBm	11 bytes	51 bytes
3	LoRa	9	125	1'760	-12,5 dB	-130 dBm	53 bytes	115 bytes
4	LoRa	8	125	3'125	-10 dB	-127 dBm	129 bytes	242 bytes
5	LoRa	7	125	5'470	-7,5 dB	-124 dBm	242 bytes	242 bytes
6	LoRa	7	250	11'000				
7	FSK 50 kbps			50'000				

Throughput / Range / Airtime

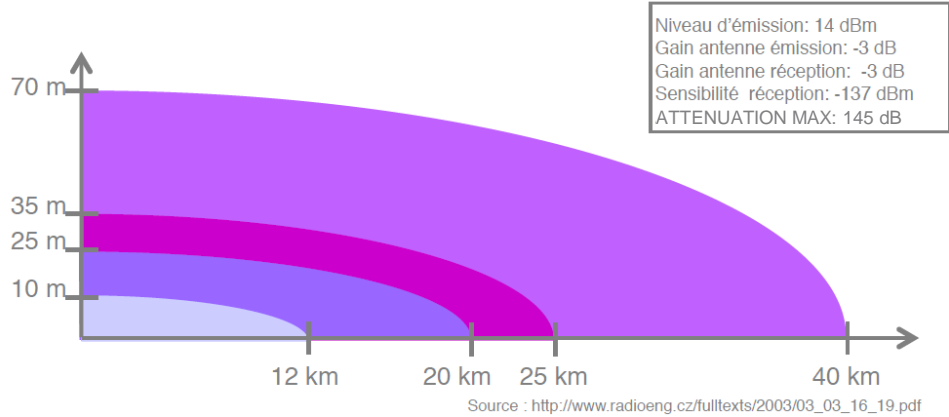

Spreading factor (at 125 kHz)	Range (indicative value, depending on propagation conditions)	Time on Air (ms) For 10 Bytes app payload
SF7	2 km	56 ms
SF8	4 km	100 ms
SF9	6 km	200 ms
SF10	8 km	370 ms
SF11	11 km	740 ms
SF12	14 km	1400 ms

(with coding rate 4/5 ; bandwidth 125Khz ; Packet Error Rate (PER): 1%)

See airtime calculator : <https://avbentem.github.io/airtime-calculator/ttn/eu868/50>

The range of the radio signal depends on the height of the Gateway (antenna) implementation but also on the propagation environment.

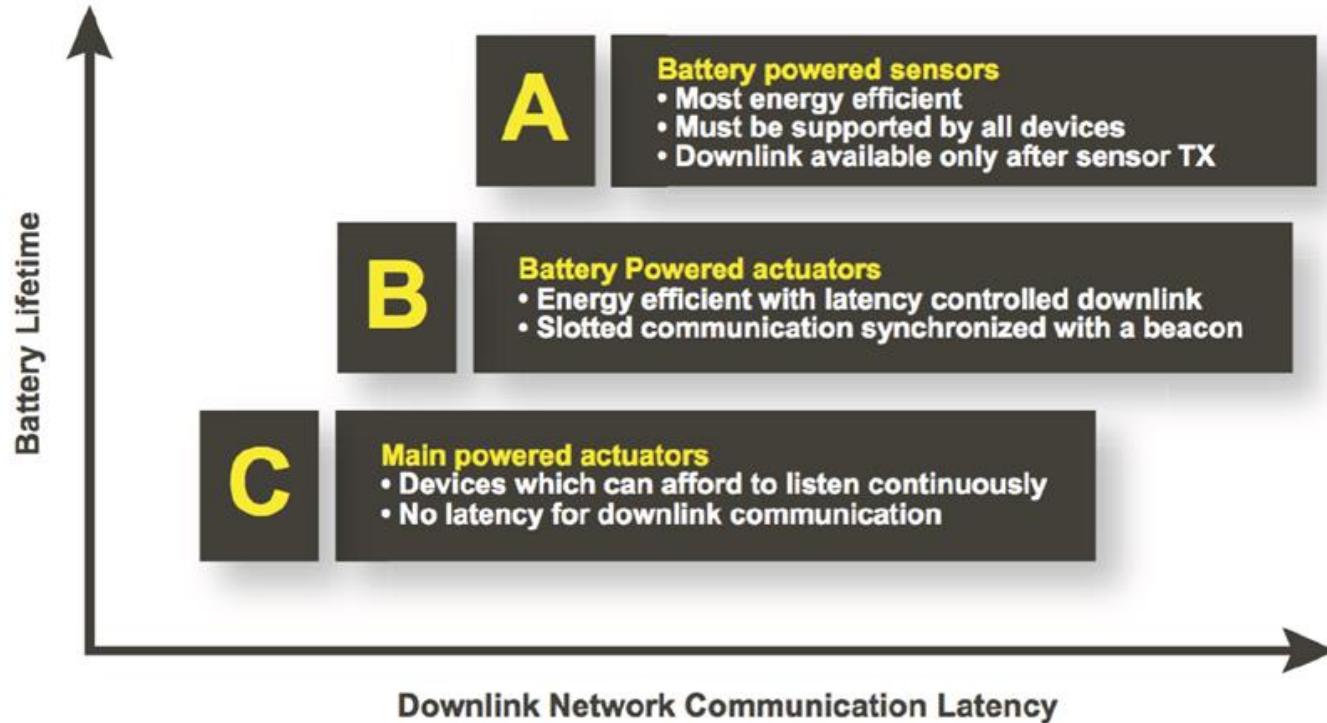

Milieu rural

Milieu Urbain

LoRaWAN classes

Channels and Downlinks

Receive Windows: Nothing is received

Receive Windows: Packet received in Rx1 window

Receive Windows: Packet is received in Rx2 window

Modulation	Bandwidth [kHz]	Channel Frequency [MHz]	FSK Bitrate or LoRa DR / Bitrate	Nb Channels	Duty cycle
LoRa	125	868.10 868.30 868.50	DR0 to DR5 / 0.3-5 kbps	3	< 1%

Table 4: EU863-870 default channels

- g (863.0 – 868.0 MHz): 1%
- g1 (868.0 – 868.6 MHz): 1%
- g2 (868.7 – 869.2 MHz): 0.1%
- g3 (869.4 – 869.65 MHz): 10%
- g4 (869.7 – 870.0 MHz): 1%

All parameters depend on regional parameters, but can be changed by the operator with **MAC** commands

Delays are usually 1 second for RX1, 1 more second for RX2

RX1 : frequency & SF depend on uplink ones

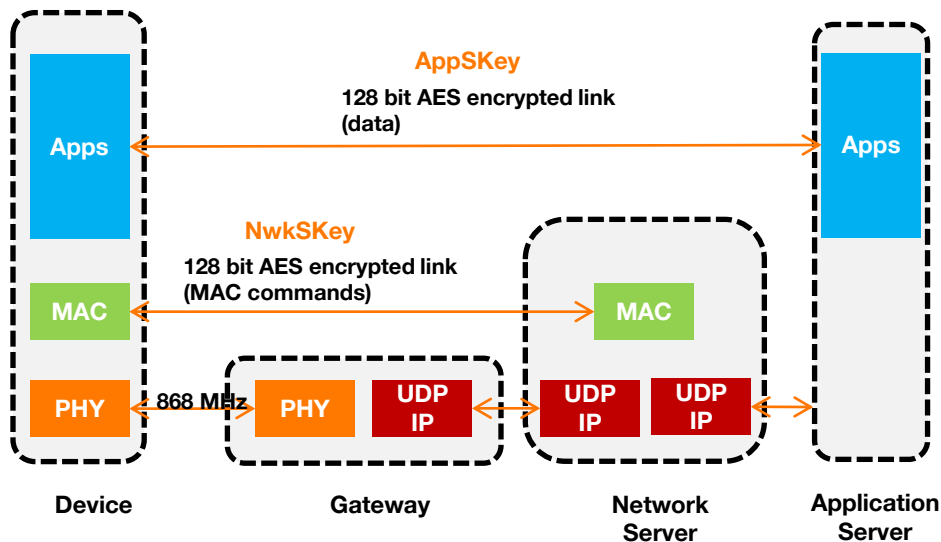

RX2 : frequency & SF are fixed

With ADR, ack on uplinks requested at least every **ADR_ACK_LIMIT+ ADR_ACK_DELAY** frames (=64+32 for Orange), or datarate lowered, or even re-join

Source: <https://lora-developers.semtech.com/library/tech-papers-and-guides/lorawan-class-a-devices>
https://lora-alliance.org/sites/default/files/2020-06/rp_2-1.0.1.pdf

Security

- Cipherring of data exchanged on the LoRaWAN network

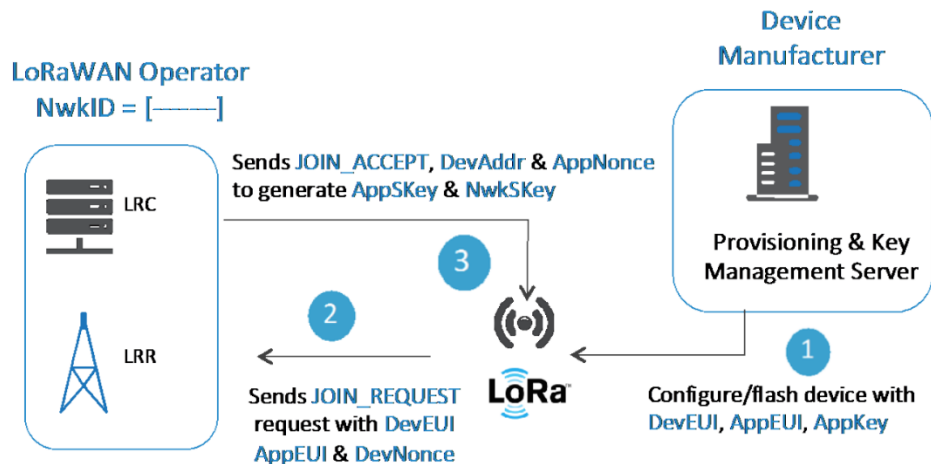

Data and Mac commands are ciphered by 2 different keys, so that the operator cannot see the application plain text

The 128-bit AppSKey is used to encrypt the payload from applications.

The 128-bit NwksKey is used by the LoRaWAN network to check the authenticity and integrity of all exchanged messages.

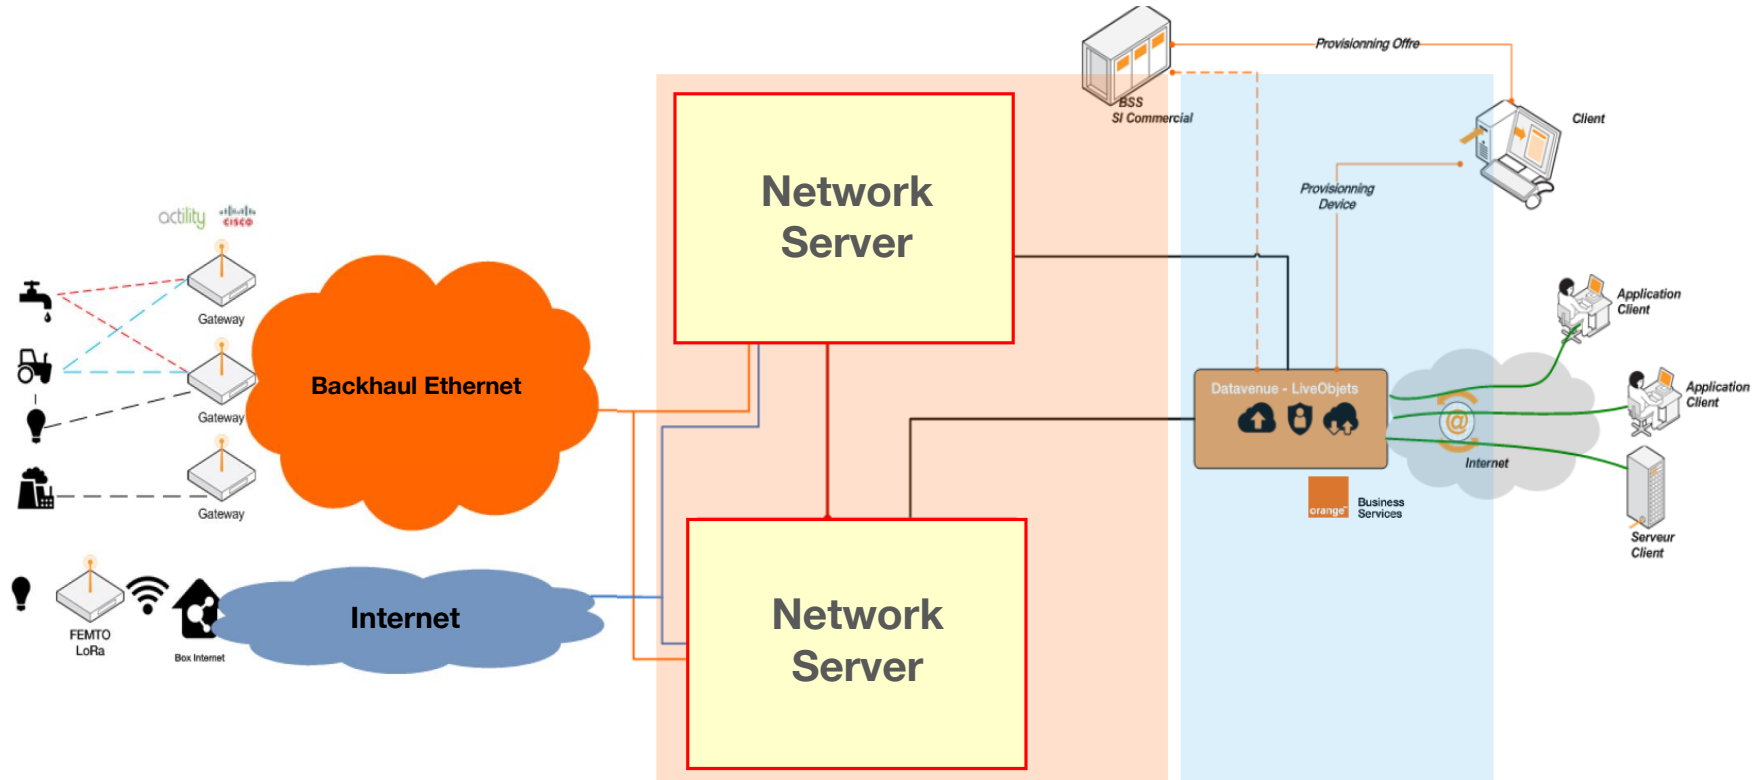

Security

- Over-the-air activation

- OTA activation consists of join-request and join-accept exchanges between the device and the network, leading to the generation of session keys : AppSKey and NwkSKey.
- OTA activation provides a high level of security as its session keys are rebuilt on a regular basis.
- On the contrary, the "Activation By Personalization" procedure defines session keys statically in the devices, is less secure, and discouraged.

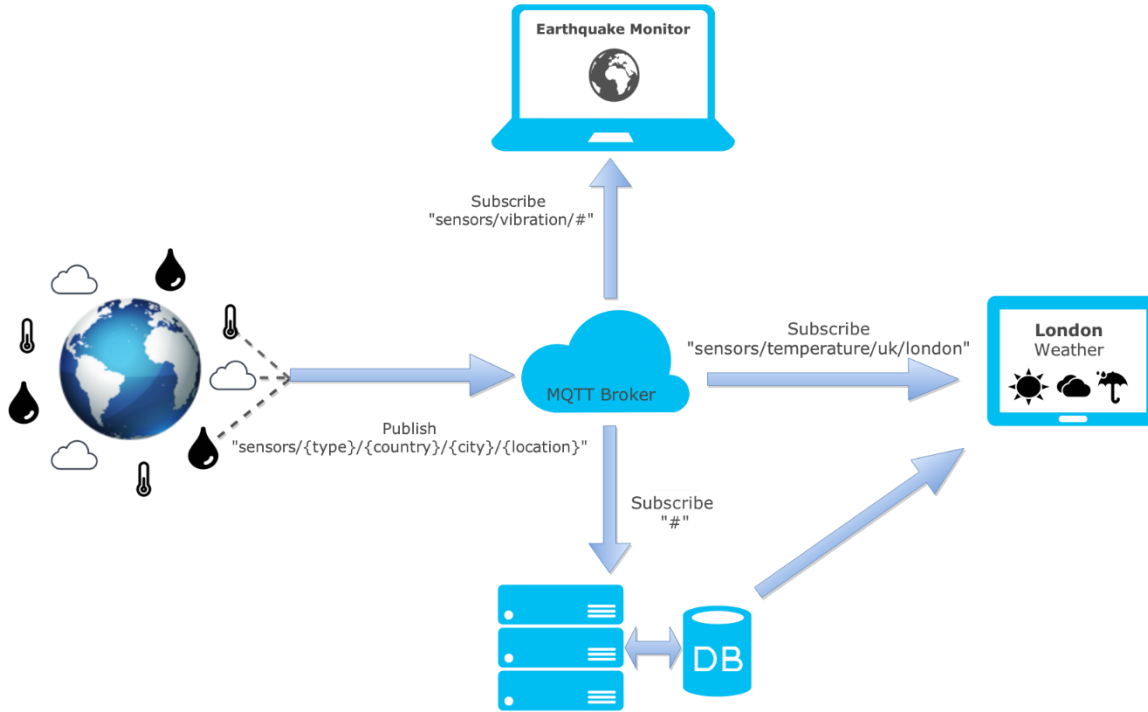

LoRaWAN Orange - architecture

#1.2

IP-based networks

IP / MQTT protocol

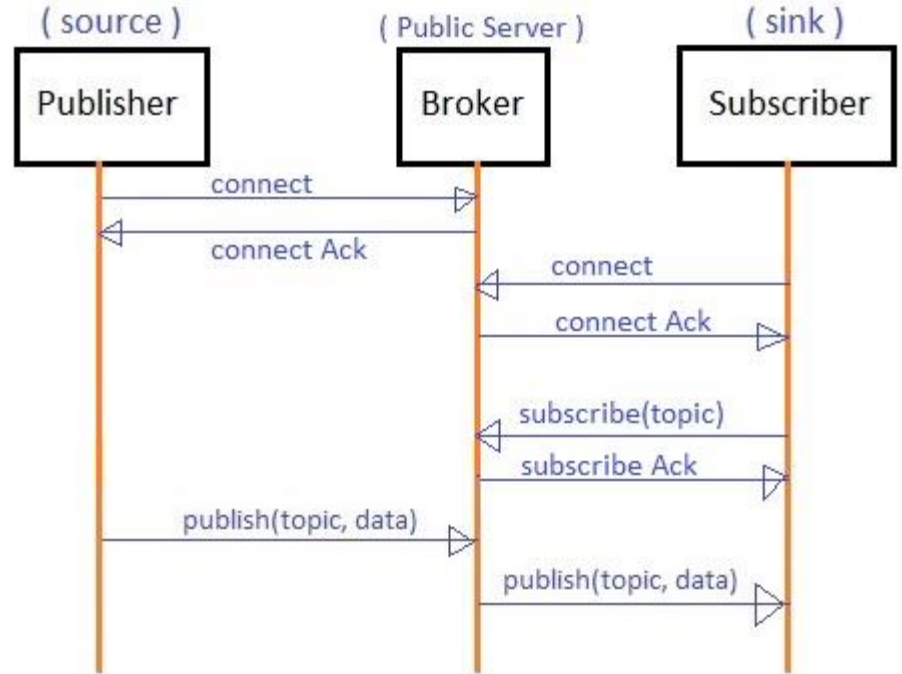

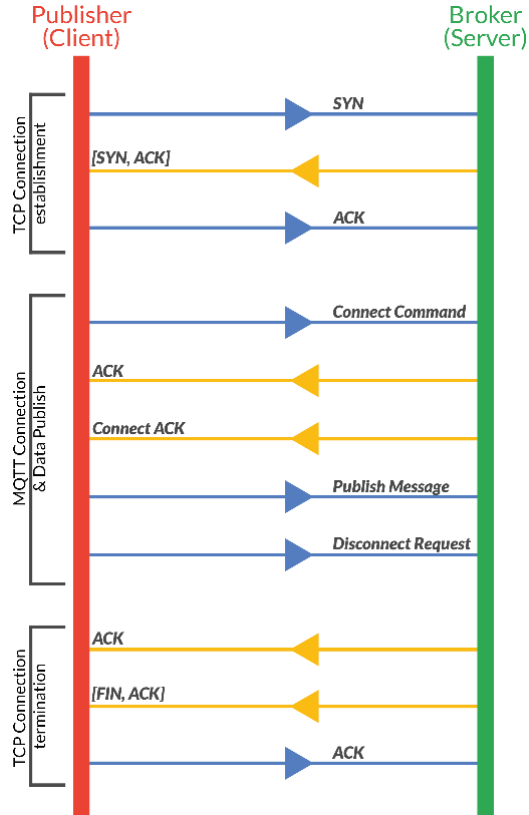

Bearer
TCP/IP
WebSockets/TCP/IP

Security
Authentication
Client ID
TLS
TLS with client auth.

QoS Level
0: no ack from subscribers
1: delivered at least once
2: delivered once

Wildcards
+ : one level
: any level

IP / MQTT protocol

IP / Lightweight M2M (LwM2M)

- **Open Mobile Alliance standard**
 - Fully standard device management
 - Fully standard data management

- **Benefits**
 - Efficient on any cellular network: 2/3/4/5G, LTE-M, and preferred for NB-IoT, ready for NIDD (no IP)
 - Plug'n play devices & reversibility
 - Devices are switchable with no integration effort
 - Off the shelf cellular device catalog
 - Non-locking architecture
 - Bootstrap : automated '0 touch' provisioning for more secured and massive deployments

- **Premium feature**
 - LwM2M is today a scarce resource among hyperscalers

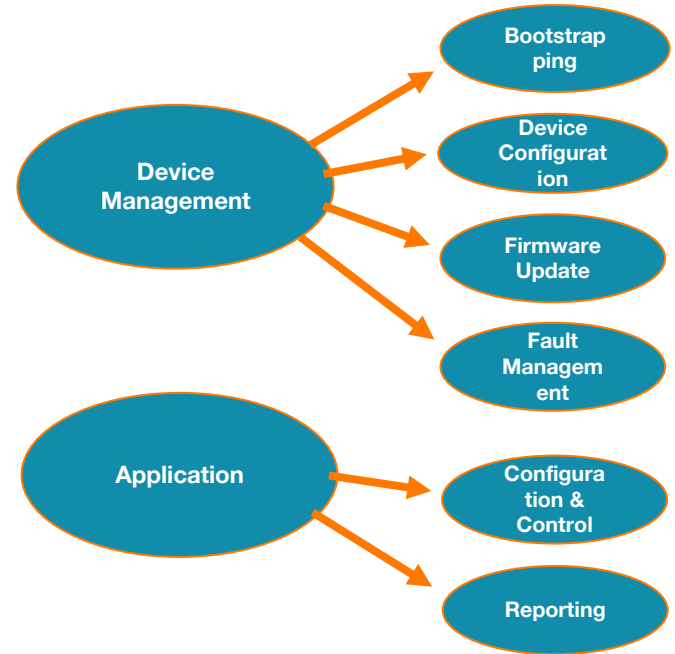

IP / LwM2M

designed with performance and the constraints of M2M devices in mind

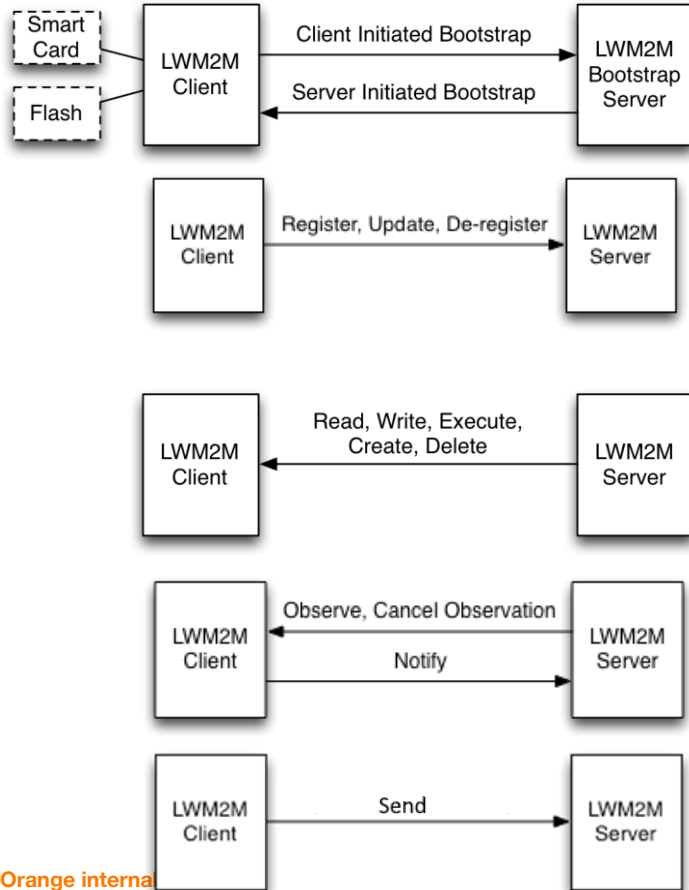

well defined **resource and data model**

built on top of the standardized **CoAP** (Constrained Application Protocol) as a variation of the HTTP protocol

DTLS security with TLS-PSK

IP / LwM2M

IPSO:

LwM2M object and resource registry (data normalization)

<http://openmobilealliance.org/wp/OMNA/LwM2M/LwM2MRegistry.html>

Example with location object:

Object definition

Name	Object ID	Instances	Mandatory	Object URN
Location	6	Single	Optional	urn:oma:lwm2m:oma:6

Resource definitions

ID	Name	Operations	Instances	Mandatory	Type	Range or Enumeration	Units	Description
0	Latitude	R	Single	Mandatory	Float		Deg	The decimal notation of latitude, e.g., -43.5723 [World Geodetic System 1984].
1	Longitude	R	Single	Mandatory	Float		Deg	The decimal notation of longitude, e.g., 153.21760 [World Geodetic System 1984].
2	Altitude	R	Single	Optional	Float		m	The decimal notation of altitude in meters above sea level.
3	Radius	R	Single	Optional	Float		m	The value in the Radius Resource indicates the size in meters of a circular area around a point geometry.
4	Velocity	R	Single	Optional	Opaque			The velocity of the LwM2M Client is defined in [3GPP-TS_23.032].
5	Timestamp	R	Single	Mandatory	Time			The timestamp of when the location measurement was performed.
6	Speed	R	Single	Optional	Float		Meters per second	Speed is the time rate of change in position of a LwM2M Client without regard for direction: the scalar component of velocity.

NB-IoT

3GPP standard, IP based, secured by SIM card, can fallback to 2G

up to 20dB coverage extension compared to GSM or broadband LTE

corresponds to a 7x increase in coverage area for an open environment, or roughly the loss that occurs when a signal penetrates the outer wall of a building

Mainly UDP-compatible

some modems/networks are TCP-compatibles

NB-IoT

optimized for **low cost**
and **low power**,
low-throughput (<20kbps)
slowly moving devices

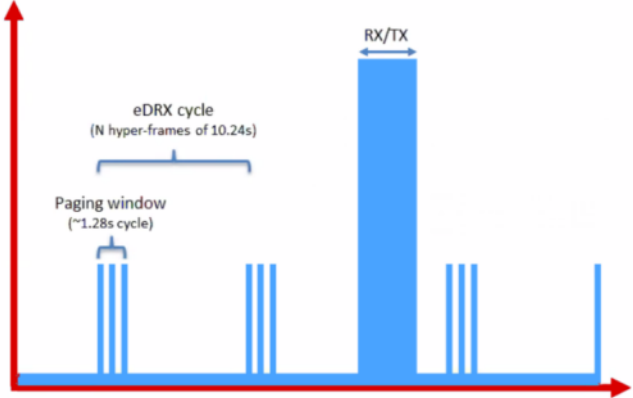

Power saving modes

PSM

eDRX

LTE-M capabilities

LTE-M **basic** features (LPWA)

Low power
Up to 10 years (1msg/day)

Long Range
Up to 10 km (+15dB)

Low cost
Target cost module ~ 5\$

LTE-M **specific** features

Bidirectional

Uplink & Downlink

Fast mobility

Up to 300 Km/h (connected HO)

Low latency

Down to 200ms

Roaming

Roaming worldwide (3GPP)

Throughputs

Up to 1 Mbps (Full duplex)

4G evolution

4G Network Software upgrade

Voice

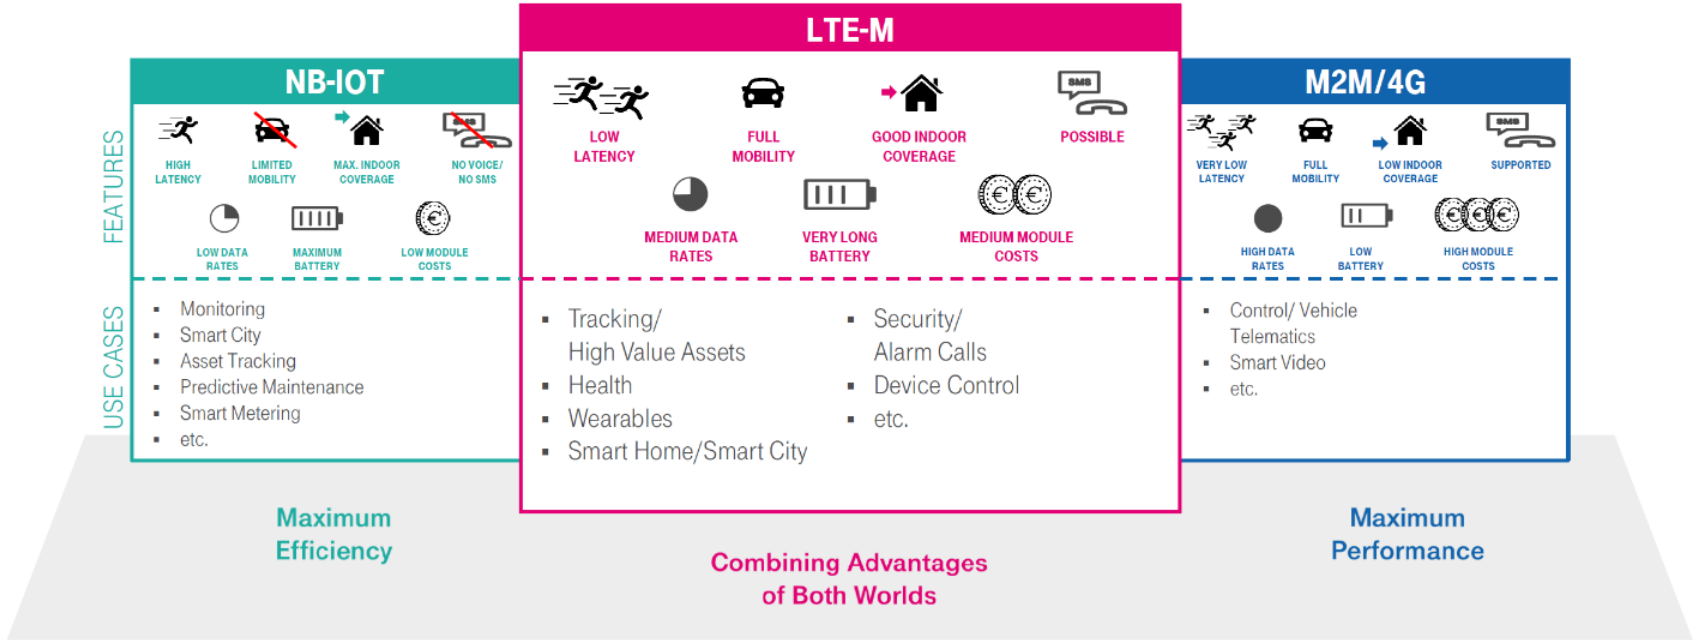

VoLTE support

Secure

(e)SIM encryption/authentication

LTE-M: BRIDGES THE GAP BETWEEN NB-IOT AND M2M/4G

Cat-M1

In Europe: 800 MHz and 1800 MHz bands

1.08 MHz channel (LTE : 5, 10, 15 or 20 MHz)

Half-duplex @ 350 kbps or full-duplex @1Mbps

Power Saving Mode (PSM) allows devices to enter scheduled deep sleep.

Extended Discontinuous Reception (eDRX) extends the modem's reception inactivity window, while listening for transmissions at set intervals.

Latency in normal coverage mode, ranging from a few hundred milliseconds in normal mode to a few dozen seconds in extension mode.

Mobility between cells in idle and connected mode ; high-speed (300 km/h)

IP for data, VoLTE for voice, SMS

LTE-M's range : better than LTE network by repetition and Extended Coverage modes A (+9dB) and B (+18dB)

L'écosystème de partenaires au service des projets IoT

Les objets et systèmes connectés sont plébiscités par un nombre croissant d'entreprises qui cherchent à améliorer leurs performances, protéger leurs équipes, innover pour leurs clients avec des produits et services différenciants. Pour les accompagner dans cette transformation, Orange et son réseau de partenaires proposent des solutions complètes : des capteurs aux logiciels métiers, en passant par la connectivité et les plateformes de gestion des données et équipements. Découvrez sur IoT Journey les solutions qui réinventent le quotidien des entreprises !

Below the text are three featured industry sectors, each with an image and a brief description:

- Utilities**: Image of a worker in a high-visibility vest kneeling on solar panels. Text: "Les Smart Utilities sont des acteurs clés dans la dynamique de la transition énergétique. La modernisation des installations permet d'optimiser la consommation des ressources et l'usage des infrastructures. Les moyens et l'exemplarité mis en place dans cette filière en particulier, avec l'IoT va jouer un rôle de différenciant sur un marché fortement concurrentiel."
- Agriculture**: Image of two people in a field looking at a laptop. Text: "La souveraineté alimentaire, le besoin de traçabilité et les défis environnementaux sont au cœur des enjeux de la Smart Agriculture. L'agriculture de précision et la robotique peuvent favoriser un usage plus durable et plus juste des ressources : intrants, eau, énergie... au service de l'agriculture européenne."
- Smart Building**: Image of a woman talking on a mobile phone in front of a modern building at night. Text: "23 % des émissions de CO2 en France proviennent des bâtiments à eux seuls, selon l'ADEME. La consommation d'énergie est donc l'un des enjeux majeurs du Smart Building. Aussi, l'optimisation des ressources utilisées passe par l'ouverture des systèmes de gestion du bâtiment, tout en mettant le confort des utilisateurs au centre de la conception des services."

Connect – a full range of connectivity options

Combining state of the art connectivity solutions to meet your specific needs
Live Objects manages seamlessly any kind of connectivity

Fixed line & satellite broadband

- High speed data transmission
- Worldwide Secure and reliable network
- Ideal for delivering large amount of data to your data centers
- Satellite adapted for uncovered locations

Cellular & LTE-M

- IP and SMS
- Global coverage through Orange mobile network and roaming partners
- Ideal for mobile embedded IoT systems
- Wide array of usages from small to large amount of data transmission
- Secure network

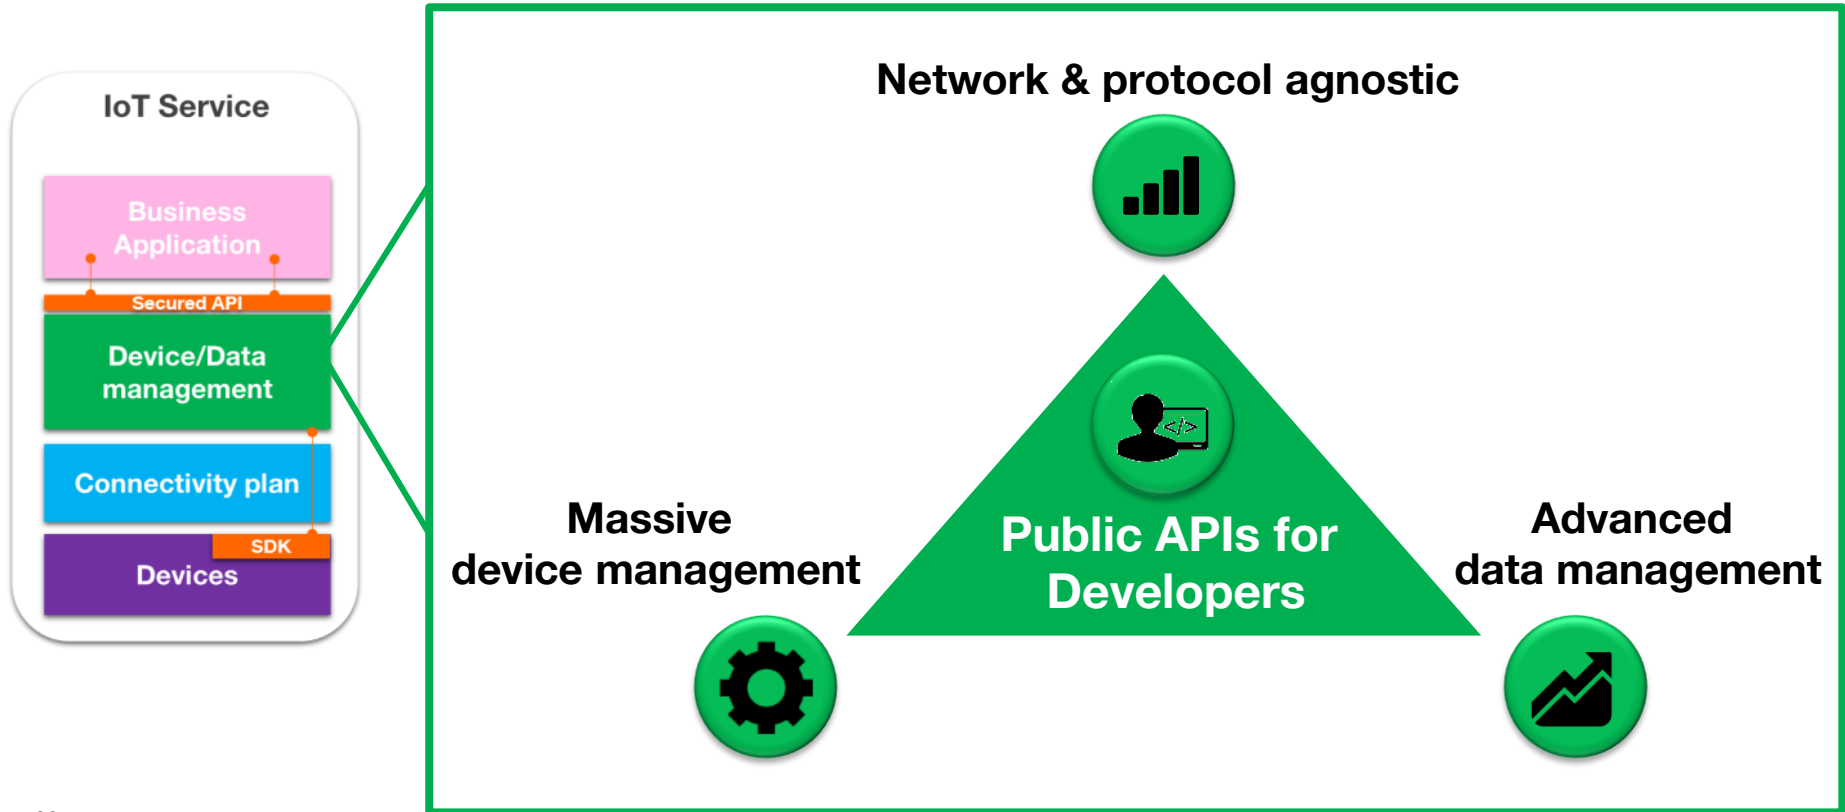

LoRa LPWA* network

- Longer battery life (up to 10 years) & reduced battery related costs.
- Adapted to areas with poor cellular network coverage
- Adapted for long life, low cost objects

Local wireless solutions

- Adapted to short range wireless transmission
- Multiple connection protocols: ZigBee, Z-Wave, Bluetooth, WiFi...
- For smart home devices, wearables...

Live Objects - overview

Secured advanced data collection & IoT fleet management

A secured and resilient, cloud-based, protocols agnostic IoT platform

Protocols/Gateways

Protocol agnostic solution

- MQTT/S
- MQTT over Websocket/S
- REST/HTTPS
- SMS
- LoRaWAN
- COAP/LwM2M
- Geolocation enrichments
 - Lora Macro
 - Cellular
 - Wifi (soon)
- Private LoRa Gateways
- API for external connectors

Advanced collect

Ensure real time messages management

- Ensure message collection, delivery, filtering & routing :
 - Real-time messaging
 - FIFO, HTTP-Push
 - Hosted connectors to public clouds
- Event triggering & routing
- Multi-interface decoder
- Metadata enrichments
- Pipelines for transformation/enrichments
- SIM/network info & events
- Edge extensions for industry & smart buildings

IoT fleet management

Manage massive device fleets

- Inventory: hierarchical Group, Tags, Properties, advanced filters
- Commands/Configuration
- Firmware Upgrade
- Events: device/command status
- Campaign management
- Activity/error log
- Silent devices alarms
- Analytics & Suspect devices
- Bootstrap

- Live Objects Sensor: open source Android app for field Technicians

Data Management

Store and manage Data

- Generic and configurable data model
- 2 levels of storage
 - Time stamped
 - Indexed structured data
- Multi criteria complex search requests
- Public API

... Ease developers life

Ready for Developers, open to Partners Connectors and Advanced features to reduce development costs

End to end Security

- Device certificate authentication support (X509)
- APN/VPN (bespoke)
- User activity logs

Developers

- Activity Log
- Free Discover offer
- LoRa/LTE-M Starter kit
- C SDK for ARM, Arduino
- C/Python/µPython for Raspberry
- Business data Widgets
- 3rd party Application enablers :
Node red, Kheiron

Orange Assets/partners bundling

- Vendor management
- KPIs for Billing API
- Codeless application development
 - Orange Node red Saas
 - Iothink – Kheiron
- Cloud Connectors: Azure Event hub, lot hub, AWS SGS, Google Cloud, Flexible Engine
- Source connectors: Kerlink (Private Lora), Sigfox

Other advanced features

- Rule engine : Event/state processing + actions on Mail/SMS/HTTP-Push/FiFo
- Geozone management
- NodeRed as a service

Architecture

- On premises, Localized SaaS

developers ecosystem

Fully documented APIs, Code, SDK, Youtube channel, technical support

The screenshots illustrate the following components of the developer ecosystem:

- Navigation and Documentation:** A sidebar menu lists 'FAQ', 'Developer guide', 'User guide', 'Swagger', 'SDK & code samples', 'Postman', and 'Tutorials'. A main section titled 'The complete Datavenue Live Objects Development Guide' offers 'Open documentation' and 'Download as PDF' options.
- Community and Support:** A 'Support' section encourages users to 'Ask the community' via a 'Consult Stack Overflow' button and provides a 'Contact the technical support' link. A 'Technical support' section offers email assistance.
- Commercial and Technical Resources:** A 'Commercial questions' section provides a 'Contact our commercial team' link. A 'Live Objects on YouTube' button is also present.
- Code Samples Table:** A table lists various code samples and their associated languages, each with a 'Github' link.
- Hardware Kit Advertisement:** An advertisement for the 'Orange explorer LoRa® kit' features a photo of the hardware and lists its specifications and components.

Type	Language	Link

Orange explorer LoRa® kit

In collaboration with Microbit, Orange is providing a development board that allows easy and quick prototyping of IoT objects and services using LoRa® technology.

Kit components:

- micro:bit edition
- mbed OS edition
- mbed OS edition
- Orange explorer LoRa® kit
- Temperature sensor: PM2.5, LED

Including:

- LoRa® module software to Orange
- LoRa® module (Orange) and LoRa® module (Micro:bit)
- Access to Live Objects platform for online and offline management
- Free access to LoRa® network for 1 month (then 10€ per device per month, taxes included) 10 and 20 according to conditions

Multi-fleet / Vendor management

Goal of vendor : Allow companies offering solutions based on Orange assets (Live Objects + connectivity), to manage their own customers and resell connectivity + Live Objects in their offers.

Types :

- multi-tenant : each tenant contracts with Orange
- reseller : only the vendor contracts with Orange. Tenant-management emails can be customized.

Architecture with vendor customers

<https://liveobjects.orange-business.com/swagger-ui-vendor/index.html>

Vendor mode

 <p>Command/Order</p>	<p>The reseller can create end-customer accounts in his administration portal in complete autonomy</p>
 <p>Support</p>	<p>Level 1 support by the reseller Level 2 support by Orange</p>
 <p>Billing Statistics</p>	<p>Overall invoicing of the reseller from Orange Usage statistics of each end customer</p>
 <p>Management of end customer accounts</p>	<p>Deleting an end customer account Suspension / Reactivation of an end customer account</p>

Vendor mode: statistics

API-Key

A user can create one or several keys, attached to the tenant (*not to himself*).

An API key allows one to access all Live Objects functions via the APIs.

It can be restricted to the rights necessary for its goal, and time limited.

It can and should be specialized Application or Device.

List API keys

The screenshot shows the 'Live Objects' Administration interface. The top navigation bar includes 'orange Live Objects', 'Dashboard', 'Devices', 'Data', 'Alarms & reports', and 'Administration' (highlighted). On the right, there are links for 'Help center' and 'Commands (...)'. The breadcrumb path is 'Administration > API keys'. A left sidebar contains navigation items: 'Account', 'Users', 'API keys' (selected), and 'Logs'. The main content area is titled 'API keys' and has two tabs: 'API keys' (active) and 'Certificates CA'. A grey notification bar states 'Traffic is limited. See offer details'. Below this, it says '3 API keys' and provides an '+ Add' button and several icons (refresh, play, pause, trash). A table lists the API keys with columns for Name, Status, Profile, Authent., and Last activity.

<input type="checkbox"/>	Name	Status	Profile	Authent.	Last activity
<input type="checkbox"/>	MqttDevKey	Enabled	MQTT Device	API key	8 months ago
<input type="checkbox"/>	app	Disabled	Application	API key	a year ago
<input type="checkbox"/>	keyForExtConnector	Enabled	External connector	API key	a year ago

At the bottom of the table, there are navigation controls: '< 1 >' and a dropdown menu showing '100'.

Create an API key

Roles : see technical documentation for details

Profile	<input type="radio"/> MQTT Device	<input checked="" type="radio"/> Application	<input type="radio"/> External connector	<input type="radio"/> Customized
Roles	Name	Description	Reading	Writing
	API Key	API Keys management Assign API_KEY_R and API_KEY_W roles	<input type="checkbox"/>	<input type="checkbox"/>
	User	Users management Assign USER_R and USER_W roles	<input type="checkbox"/>	<input type="checkbox"/>
	Account	Account configuration Assign SETTINGS_R and SETTINGS_W roles	<input type="checkbox"/>	<input type="checkbox"/>
	Device	Device management Assign DEVICE_R and DEVICE_W roles	<input type="checkbox"/>	<input type="checkbox"/>
	Data Processing	Data Decoders and Events Processing management Assign DATA_PROCESSING_R and DATA_PROCESSING_W roles	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

	Bus access	Message Bus access using MQTT or HTTP Assign BUS_R and BUS_W roles	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

4.4. Role

A Role can be attributed to an **API key** or **user account**. It defines the privileges of this user or API key on Live Objects.

Important Notice : Some features are only available if you have subscribed to the corresponding option, so you may have the proper **roles** set on your user but no access to some features because these features are not activated on your tenant account.

The currently available roles and their inclusion in Admin or User profiles:

Role Name	Technical value	Admin profile	User profile	Privileges
API Key	API_KEY_R	X	X	Read parameters and status of an API key .
API Key	API_KEY_W	X	X	Create, modify, disable an API key .
User	USER_R	X	X	Read parameters and status of a user .
User	USER_W	X		Create, modify, disable a user .
Settings	SETTINGS_R	X	X	Read the tenant account custom settings.
Settings	SETTINGS_W	X	X	Create, modify tenant account custom settings.
Device	DEVICE_R	X	X	Read parameters and status of a Device (aka Asset) .
Device	DEVICE_W	X		Create, modify, disable a Device (aka Asset) , send command, modify config, update resource of a Device.
Device Campaign	CAMPAIGN_R	X	X	Read parameters and status of a massive deployment campaign on your Device Fleet.
Device Campaign	CAMPAIGN_W	X		Create, modify a massive deployment campaign on your Device Fleet.

Copy/paste the key, it appears only once!

API security

As of October 31st, 2020 :

- **devices:**
 - **endpoint:** mqtt://mqtt.liveobjects.orange-business.com
 - **TLS 1.2** (or better) required on HTTP APIs
 - **TLS 1.2** (or better) strongly advised on MQTT APIs
 - **plain-text MQTT** tolerated only with an API-key limited to **DEVICE_ACCESS** rights
 - **2-way-handshake TLS** advised
- **applications:**
 - **endpoint:** mqtt://liveobjects.orange-business.com
 - **TLS 1.2** (or better) required on all APIs (MQTT, HTTP, WebSocket)

MQTT connection with devices - device TLS certificate

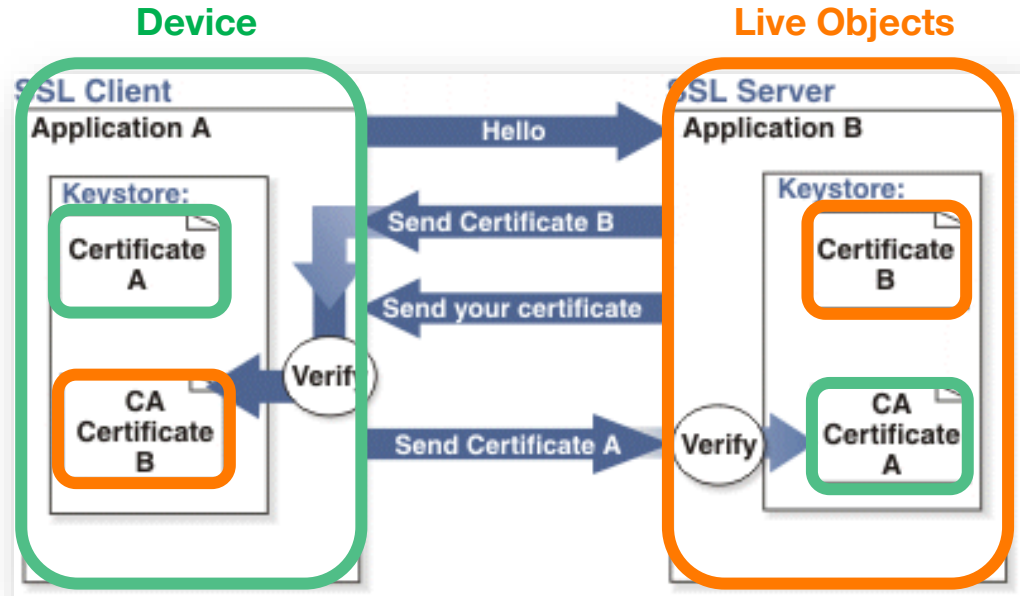

Best security for devices,
recommended implementation for
production

Customer CA (in green) is stored in Live
Objects, associated to an API-Key

Each device has a unique certificate
signed by the customer CA

Operation mode described in the
developer guide:

https://liveobjects.orange-business.com/doc/html/lo_manual_v2.html#_go_further_and_use_2_way_authentication

Traffic limits

Example
with a
premium+
account

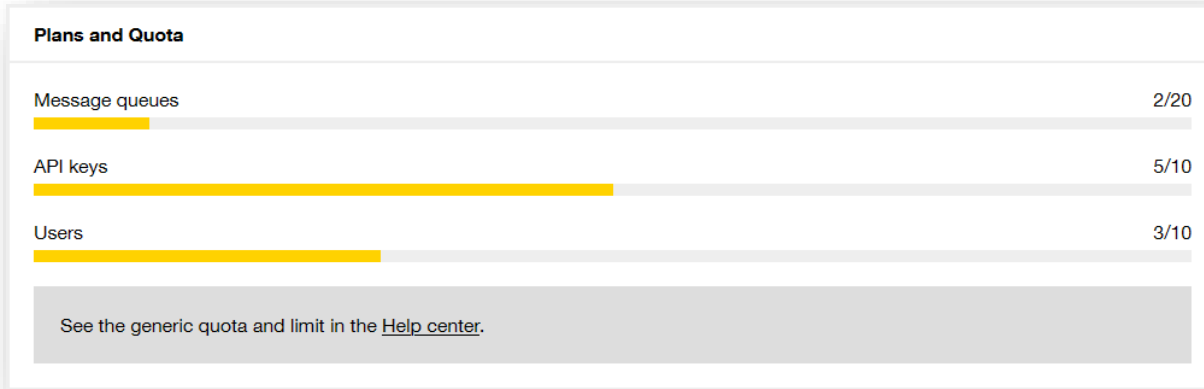

<<	Account
 Account	Traffic limits
 Users	MQTT applications For your applications connected in MQTT: the traffic entering Live Objects is limited to 50 messages in a window size of 1 second globally and to 25 messages in a window size of 1 second by API key. The number of simultaneous connections is limited to 100.
 API keys	MQTT devices For your devices connected in MQTT: the traffic entering Live Objects is limited to 50 messages in a window size of 1 second globally and to 5 messages in a window size of 1 second by API key. The number of simultaneous connections is limited to 100.
 Logs	MQTT external connector For your external connectors connected in MQTT: the traffic entering Live Objects is limited to 50 messages in a window size of 1 second globally and to 25 messages in a window size of 1 second by API key. The number of simultaneous connections is limited to 100.
	HTTP in For your applications or devices connected in HTTP: the traffic entering Live Objects is limited to 25 requests in a window size of 1 second globally and to 25 requests in a window size of 1 second by API key.
	Http Push For your applications receiving messages with HTTP push : the traffic outgoing from Live Objects is limited to 25 requests in a window size of 1 second globally
	SMS notification The number of SMS notifications outgoing from Live Objects is limited to 100 messages per day
	Email notification The number of email notifications outgoing from Live Objects is limited to 1000 messages per day

Information on MQTT frames:
in the portal activity logs when exceeded

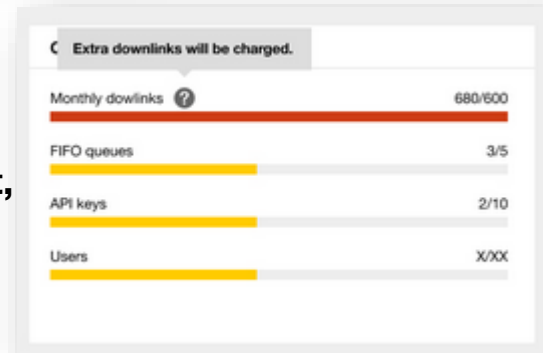

Information in HTTP responses:

```
X-RateLimit-Limit: 5  
X-RateLimit-Remaining: 3  
X-RateLimit-Reset: 1479745936295
```

Quotas

LoRa downlinks are limited per month for the whole fleet, Charged afterwards

MQTT debug : activate on an API-Key

in the keys view

or in the logs view

OMAdev

Activate debug mode

i Information

Name: OMAdev

Status: ● Enabled

Debug mode: ● Deactivated

Description: Child of MasterKey

Value: *The API key value is hidden for security reasons*

Configure debug mode

API key name: OMAdev

Debug mode duration: [1-6] Hours

Be aware that this duration will be applied to devices using the same API key

Cancel Ok

Auto-create

Activating the debug mode allows to trace in the activity log all the connection logs made with this API key. Error logs are always logged in the activity log even if debug mode is deactivated

Activate debug mode

tools for APIs

Postman : installation

Portable version : <https://portapps.io/app/postman-portable/#download>

Shared collection

<https://documenter.getpostman.com/view/1510363/live-objects-training-publish/7TJCtGP>

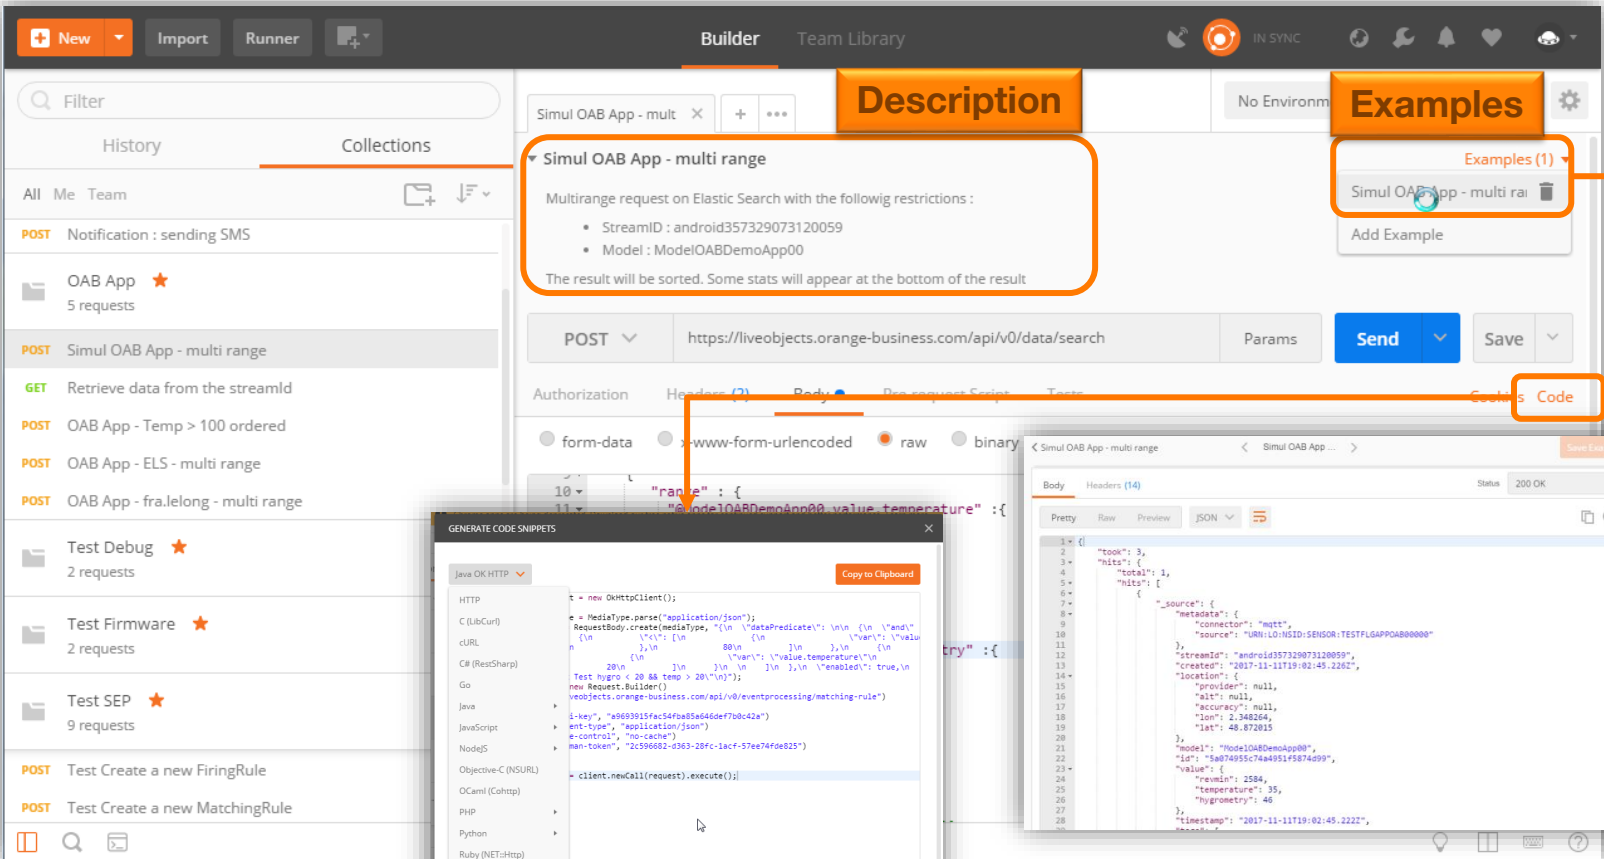

The screenshot shows a Postman API documentation page for the endpoint `PUT Save or update an action policy`. The page is divided into several sections:

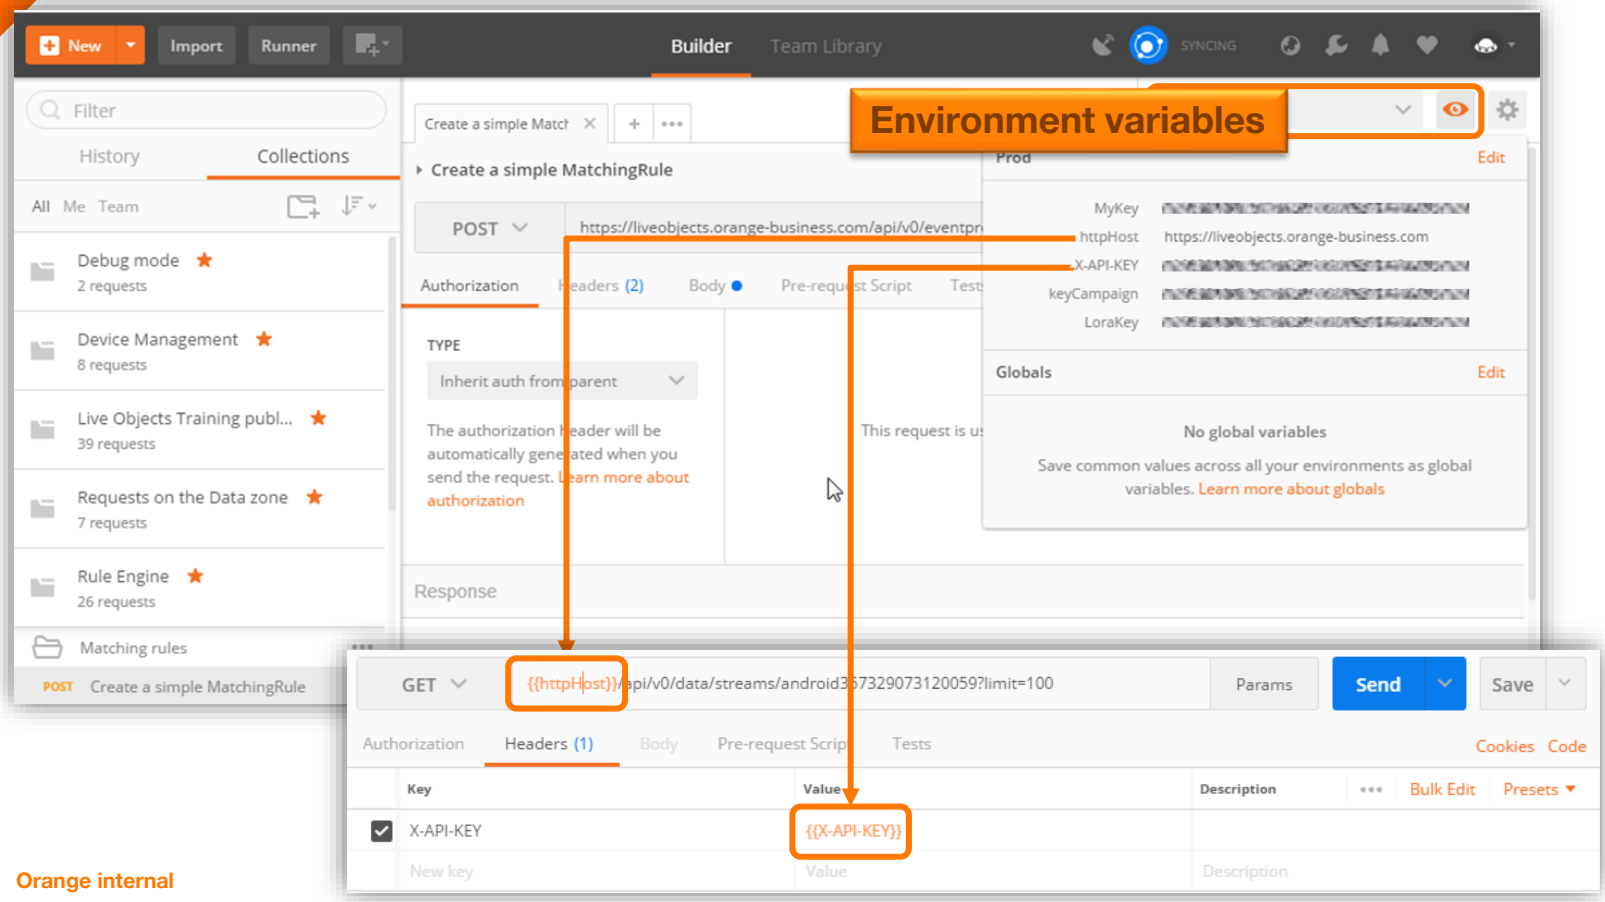

- Introduction:** A sidebar on the left lists various API sections under the heading "LIVE OBJECTS TRAINING PUBLISH".
- URL:** The endpoint is `https://liveobjects.orange-business.com/api/v0/event2action/actionPolicies/f3a1f839-31fc-4f80-a7d2-f13f0ae7041a`.
- Description:** The `id` field is mandatory in the path but optional in the payload. It must match the `id` specified in the path, otherwise an HTTP 400 will be issued.
- Restrictions:** Restricted to API keys with at least one of the following roles: `DATA_PROCESSING_W`.
- HEADERS:**

Accept	application/json
Content-Type	application/json
X-API-KEY	{{X-API-KEY}}
- BODY:** A JSON payload is shown in a code block:

```
{  "eventRuleIds": ["b87900ce-16f8-4b37-a723-78d23635ab1"],  "actions": {    "emails": [{"cc": ["franck.lelong@orange.fr"], "cc": "subjectTemplate": "Hvqro < 80 && Temp > 20",
```
- Sample Request:** A terminal window shows the curl command:

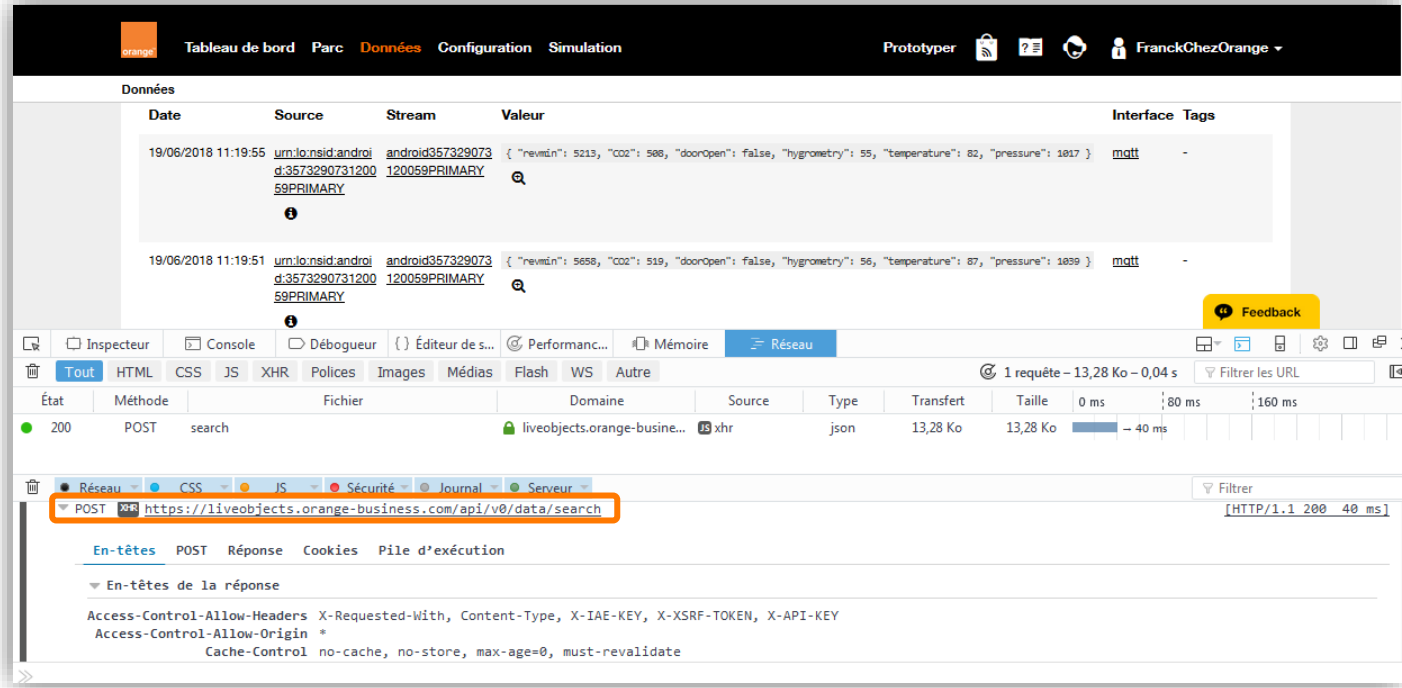

```
curl --request PUT \  --url https://liveobjects.orange-business.com/api/v0/event2action/actionPolicies/f3a1f839-31fc-4f80-a7d2-f13f0ae7041a \  --header 'Accept: application/json' \  --header 'Content-Type: application/json' \  --header 'X-API-KEY: {{X-API-KEY}}' \  --data '{  "name": "Test EventToAction app Android updated",  "enabled": false,  "triggers": {
```

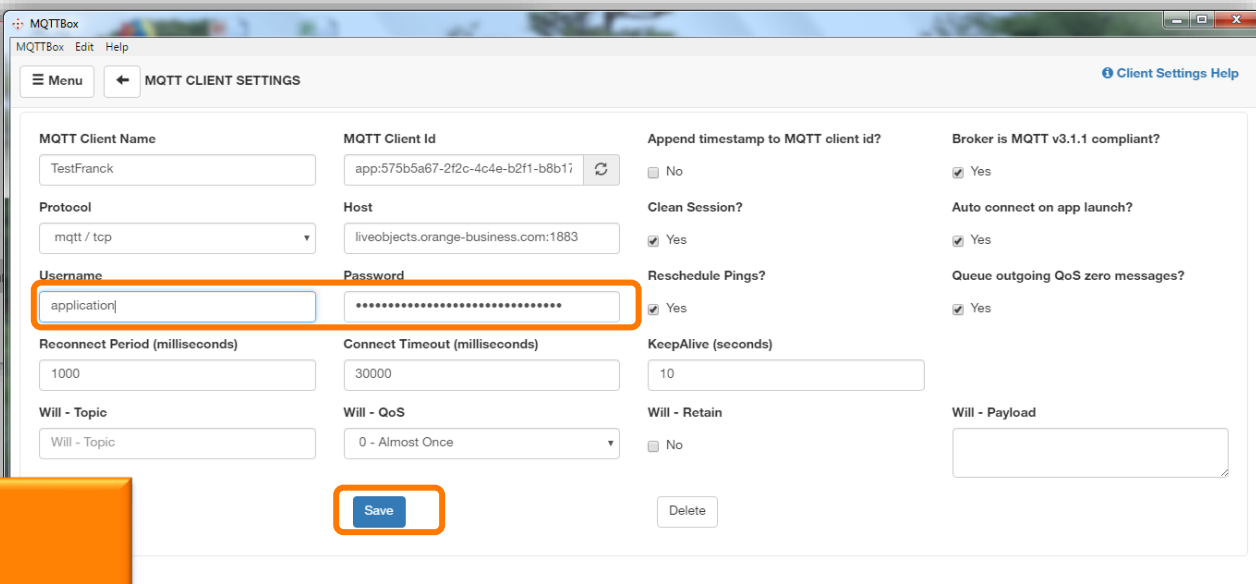

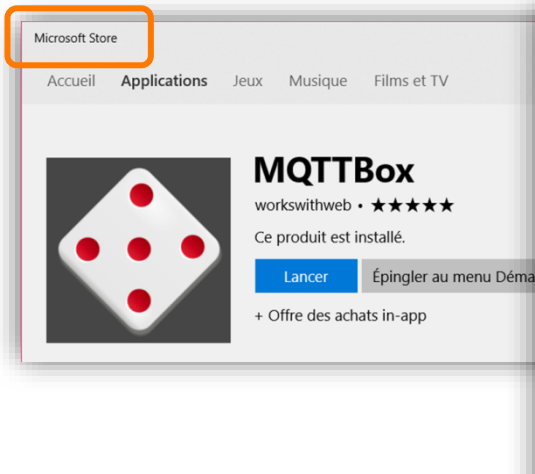

Web browsers : use the developer tools (F12) !

The portal behavior is an efficient reference

MQTT Box : install/configure a client *Mqtt/WebSocket, admin install*

User name : « application »
Password : Live Objects API Key

Plain text:
MQTT: liveobjects.orange-business.com:1883
WebSocket: ws://liveobjects.orange-business.com:80/mqtt

SSL/TLS (1- or 2-way authentication):
MQTTS: liveobjects.orange-business.com:8883
WebSocket: wss://liveobjects.orange-business.com:443/mqtt

Subscribe to topics, ex :
Application : « fifo/testFifo »

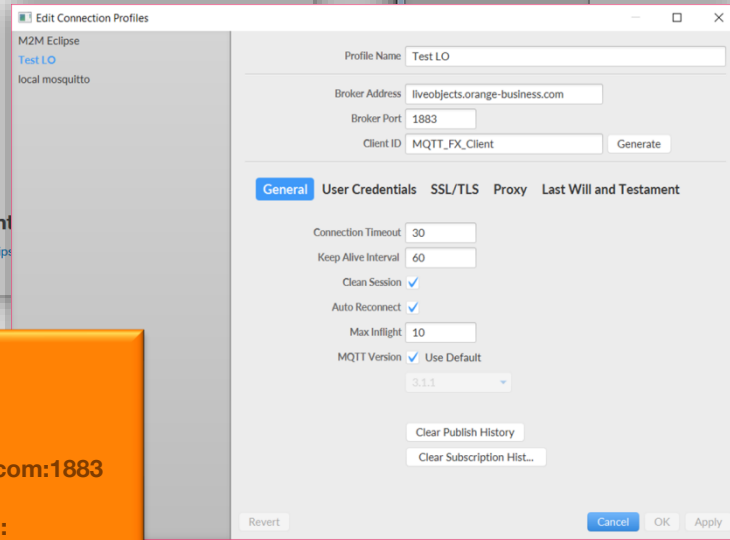

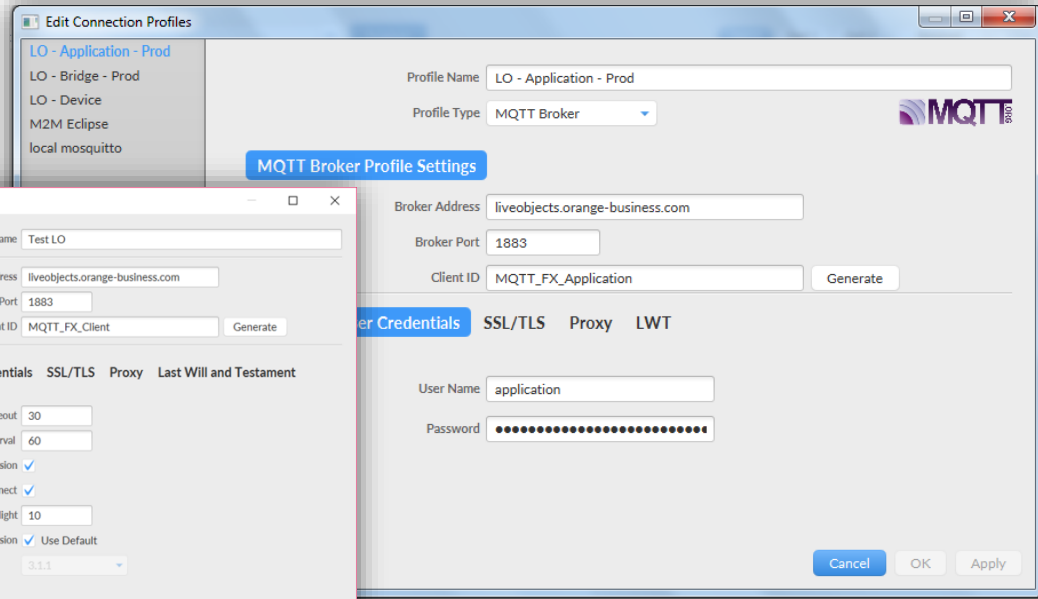

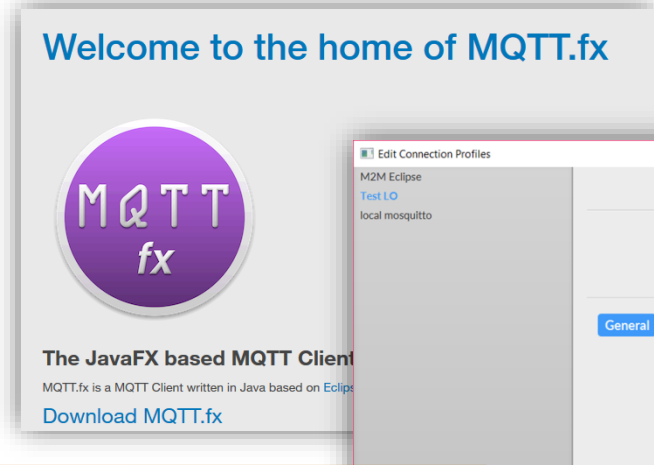

The screenshot shows the MQTTBox application interface. At the top, there is a title bar with 'MQTTBox' and a menu bar with 'MQTTBox Edit Help'. Below the menu bar, there are several buttons: 'Menu', a back arrow, a green 'Connected' status indicator, 'Add publisher', 'Add subscriber', and a settings gear icon. The address bar shows 'test_L0 - mqtt://liveobjects.orange-business.com:1883'.

The main content area is divided into two panels. The left panel, titled 'Topic to subscribe', has a text input field containing 'fifo/testFifo' (highlighted with an orange box). Below the input field is a 'QoS' dropdown menu set to '0 - Almost Once' and a 'Subscribe' button. Below these elements is a preview of the JSON message that will be received upon subscription.

The right panel, titled 'fifo/testFifo', displays the received JSON message in a text area. The message is a JSON object with various fields including streamId, timestamp, location, model, value, and metadata. Below the message, there is a summary of the message properties: 'qos : 0, retain : false, cmd : publish, dup : false, topic : fifo/testFifo, messageId : , length : 521, Raw payload : 123341151161'.

List the devices (general or specialized view)

The screenshot shows the 'Live Objects' interface. The top navigation bar includes 'Dashboard', 'Devices', 'Data', 'Alarms & reports', and 'Administration'. The 'Devices' tab is active. Below the navigation bar, there is a breadcrumb 'Devices > All devices'. A dropdown menu is set to 'All devices', which is highlighted with an orange box. To the right of the dropdown are buttons for '+ Add device' and 'Mass import'. The main content area is titled 'All devices' and contains a search bar, filter buttons (ID, Name, Tag, Property, Activation, Interface status, Silent machine, Connectivity), and a table of devices. The table shows 0 selected devices out of 316 total. Two devices are listed: 'Explorer 3' and 'Explorer 2', both with 'Activated' status and 'LoRa' connectivity.

<input type="checkbox"/>	Name ▾	Device ID ▲	Group ▾	Tags	Connectivity	Status	Last comm. ▾

<input type="checkbox"/>	Explorer 2	urn:lo:nsid:lora:0004A30B00203F08	/		LoRa	● Activated	09/27/2021 7:20:43 PM

Object provisioning

Unitary provisioning : portal

Common fields:

- Name
- Tags (x10)
- Properties (x10)
- Group
- Static location

- ID & Stream for extended usecases

The screenshot displays the 'Live Objects' management interface. At the top, there is a navigation bar with the 'orange' logo and menu items: 'Dashboard', 'Devices', 'Data', 'Alarms & reports', and 'Administration'. A search icon and 'Help center' link are on the right. Below the navigation bar, the page title is 'Devices > All devices'. A dropdown menu shows 'All devices', and there are buttons for '+ Add device' and 'Mass import'. The main content area shows a list of devices, with one device selected and its 'Device information' form open. The form includes the following fields:

- Name:** Text input field containing 'My New Device'.
- Device ID & Default StreamId format *:** Radio buttons for 'LoRa' and 'SMS'.
- Device ID *:** Text input field containing 'urn:lo:nsid:...'. A 'Personalize' button is to the right.
- Default StreamId * ?:** Text input field containing '...'. A 'Personalize' button is to the right.
- Group *:** Text input field containing '/'. A dropdown arrow is on the right.
- Tags:** Text input field containing 'Add tag(s)'.
- Properties:** A table with two columns: 'Enter the property label' and 'Enter the property value'. There are delete and add icons on the right.
- Static location ?:** Three text input fields for 'Latitude' (Example: 48.85725), 'Longitude' (Example: -1.5), and 'Altitude' (Example: 10). A note below states 'Altitude in meters. This field is optional.'

LoRa specific parameters

DevEui

Unique and permanent identifier of each sensor (MAC equivalent Address).

This number is assigned to the LoRa sensor by its manufacturer in a slot managed and awarded by the IEEE.

The DevEUI is stored in the sensor.

AppEui

Identifier of the embedded application in the sensor.

The exact use of this parameter can still evolve in the next versions of the LoRaWAN standard.

The AppEUI is stored in the sensor at the time of its manufacturing (by default) or later, at the time of its personalization.

AppKey

Unique secret key stored in each sensor and shared with LoRa network.

This 128-bit key is the primary encryption key that is used to create other NwkSKey and AppSKey session keys.

#5.2

Device Management
Advanced

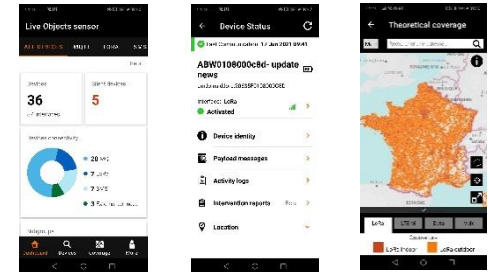

“Live Objects sensor” : the Android application for technician adaptable to your specific business needs

Help with the deployment & installation of your equipment fleet

Main features

- Theoretical network coverage maps for IoT connectivity for Spain and France
- Device dashboard
- Search for a device
 - for the device to install using:
 - filters as ID, Name, Group name, Interface status, Connectivity, or Silent machine alarm
 - QRcode / BarCode using specific format
 - NFC
- Device info
 - with the possibility to edit them (manually or using OCR):
 - Device information (status, Battery, interface, tags, Properties)
 - Silent machine Alarms
 - Network signal (only for LoRa)
 - Uplink messages
 - Activity logs
 - MQTT parameters configuration
- Activate Lora devices
- Static outdoor location⁺ of your device thanks to the GPS coordinates of your mobile and store indoor information of the installation location (building, floor, room)
- Show on map⁺ the device static location or the network one
- Installation report⁺ generation including pictures

Analytics and Suspect Devices

- weekly report by email + latest report downloadable on the portal
- evolution of your devices : quantity and status
- AI-powered analytics

The screenshot displays the Datavenue Live Objects web interface. The top navigation bar includes 'Datavenue Live Objects' and menu items: 'Dashboard', 'Devices', 'Data', 'Alarms & reports' (highlighted), and 'Administration'. On the right, there are links for 'Help center' and 'TrainingMa...'. Below the navigation, a breadcrumb trail shows 'Alarms > Analytics > Reports'. The main content area is titled 'Analytics & suspect devices' and features a left sidebar with options: 'Alarms history', 'Alarms configuration', and 'Analytics & suspect devices' (selected). An 'Add a report' button is located in the top right of the main content area. A table below lists device analytics:

Name	Connectivity	Language	Status	Recipients
lora devices	LoRa	FR	● Activated	To: notification@company.com Cc: - Cci: -

Analytics and Suspect Devices

La flotte est composée de 12 équipements avec une connectivité LoRa dont 9 dans l'état ACTIVATED. Ci-dessous la décomposition de votre flotte par état, ainsi que son évolution.

Device breakdown by status (2022-02-28)

Device breakdown by status over time

9 équipement(s) sont dans l'état ACTIVATED mais n'ont pas communiqué avec Live Objects.

Anomalies d'accès au réseau LoRa

Cette section rapporte les équipements LoRa ayant eu des anomalies de procédure de Join Request / Join Accept.

Multiplés Join Request sans Join Accept

0 équipement(s)

Multiplés Join Request et Join Accept

0 équipement(s)

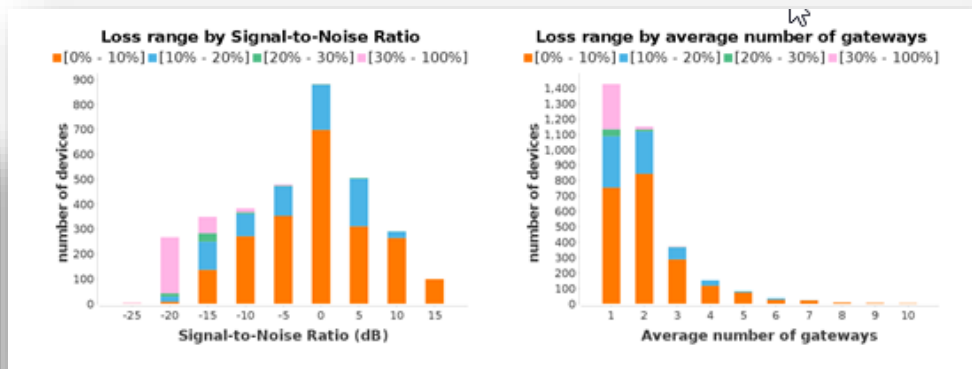

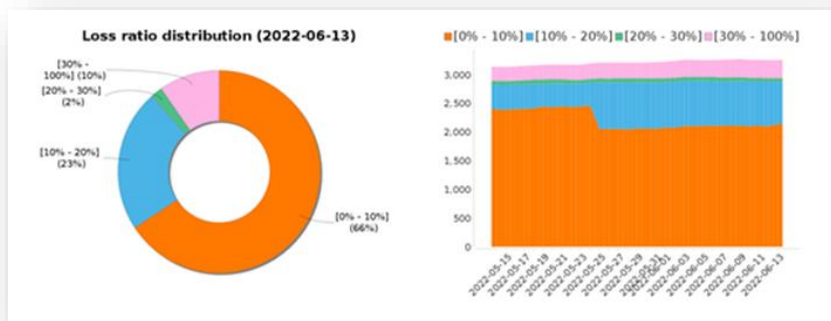

Analyse de la flotte

La flotte comporte moins de 10 équipements ayant émis récemment des messages.

L'analyse par équipement est disponible dans le fichier en pièce jointe.

Static location

Configure a location at installation (not given by the device nor network)

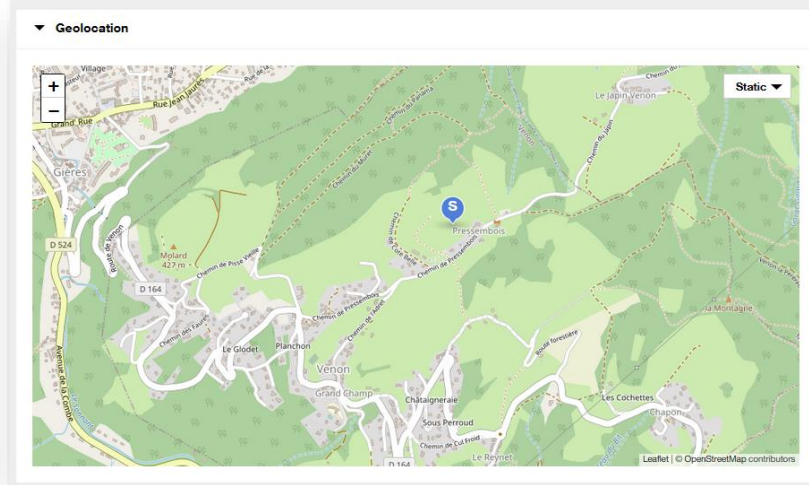

- By API
- By *Live Objects Sensor* mobile application (phone GPS or manual)
- In web portal soon

That location is added on Live Objects maps and in every enriched frame.

Several locations can be concurrent : static, by the device, by the network.

See how the priority applies here :

https://liveobjects.orange-business.com/doc/html/lo_manual_v2.html#_priority_location

```
"location": {  
  "provider": "static",  
  "alt": 12,  
  "lon": 164.7337728,  
  "lat": 80.8596736  
}
```

Device explorer APIs

Querying or Counting devices based on RSQL criteria :

Name, id

Properties, tags, group

Interface type and status

Geo-bounds

With sorting and response-limits, paginated, grouped (incl. by location)

The screenshot displays a REST client interface with a POST request to `https://liveobjects.orange-business.com/api/v1/deviceMgt/explorer/search`. The request body is a JSON object with a `filters` property containing a `queryString` with an RSQL query: `!(tags==myTag and name==awesome*) or (groupPath=/* or properties=q'k==Version and v==V2' or interfaces.connector==lora)`. The response body is a JSON object with a `bookmark` array containing a single URN and a `devices` array containing one device object. The device object includes fields for `id`, `name`, `description`, `group`, `tags`, `properties`, and `interfaces`.

```
POST https://liveobjects.orange-business.com/api/v1/deviceMgt/explorer/search

{
  "filters": {
    "queryString": "!(tags==myTag and name==awesome*) or (groupPath=/* or properties=q'k==Version and v==V2' or interfaces.connector==lora)"
  }
}

{
  "bookmark": [
    "urn:lo:nsid:x-connector:myconnect01"
  ],
  "devices": [
    {
      "id": "urn:lo:nsid:android:356437083184592PRIMARY",
      "name": "OMA-tel device (mqtt / urn:lo:nsid:android:356437083184592PRIMARY)",
      "description": "This device was auto registered by the connector [mqtt] with the nodeId [urn:lo:nsid:android:356437083184592PRIMARY]",
      "group": {
        "id": "root",
        "path": "/"
      },
      "tags": [
        "omatag"
      ],
      "properties": {
        "omapropl": "prop1value"
      },

Notification of a new version :
- Select « MAJ » => the image/firmware has changed

MQTT: firmware management : upgrade status

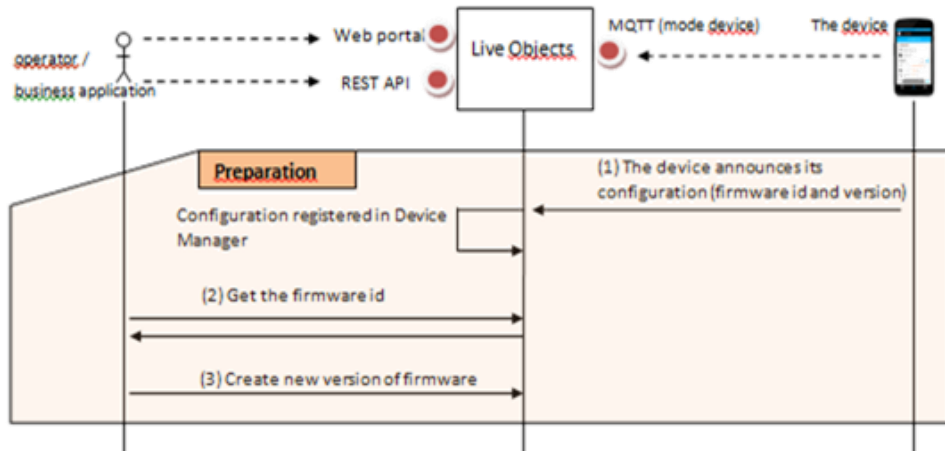

Status & history on the portal

The screenshot shows the Orange Datavenue portal interface. The top navigation bar includes 'Dashboard', 'Park', 'Data', 'Configuration', and 'Simulation'. The main content area is titled 'Live Objects' and shows a breadcrumb path: 'Park > MANAGED/MQTT > android / 357329073120059 > Firmwares'. A sidebar on the left contains navigation options: Identity, Status, Parameters, Commands, and Firmwares. The main panel displays the 'Firmwares' section for the device 'android / 357329073120059'. It features a table with columns: Firmware Id, Last refresh, Current version, Current version date, Target version, Target version date, Update status, and Actions. The 'Current version' and 'Update status' columns are highlighted with purple boxes. A 'Cancel update' button is visible. Below the table is a pagination control showing '1' of 20 items. The 'Update history' section is also visible, with a table containing columns: Id, Firmware Id, Source, Target, Update topic, Start date, Status, Progress (%), and Refresh date. This table is also highlighted with a purple box. A 'Cancel update' button is also present in the update history section.

Firmware Id	Last refresh	Current version	Current version date	Target version	Target version date	Update status	Actions
demo_splash_screen	11/15/2017 9:20:23 AM	V2	11/15/2017 9:20:23 AM	V2	11/15/2017 9:09:58 AM	DONE - 100%	Update

5a0b16544c92075320881337	demo_splash_screen	v1.0	V2	pubsub/-/815cc44850b148d8906a5a41c23b8081	22 minutes ago	DONE	100	12 minutes ago

MQTT: firmware management : upgrade using API

1 Device on : MQTT topic dev/rsc

```
{
  "rsc": {
    "demo_splash_screen": {
      "x": "1.0"
    }
  }
}
```

2 Get the device firmware Id
GET <https://liveobjects.orange-business.com/api/v0/rm/asset/android/357099070479549?page=0&size=20>

Answer :

```
{
  "page": 0,
  "size": 20,
  "totalCount": 1,
  "data": [ {
    "tenantId": "582b0a510cf22e0747c3fa70",
    "assetIdNamespace": "android",
    "assetId": "357099070479549",
    "resourceId": "demo_splash_screen",
```

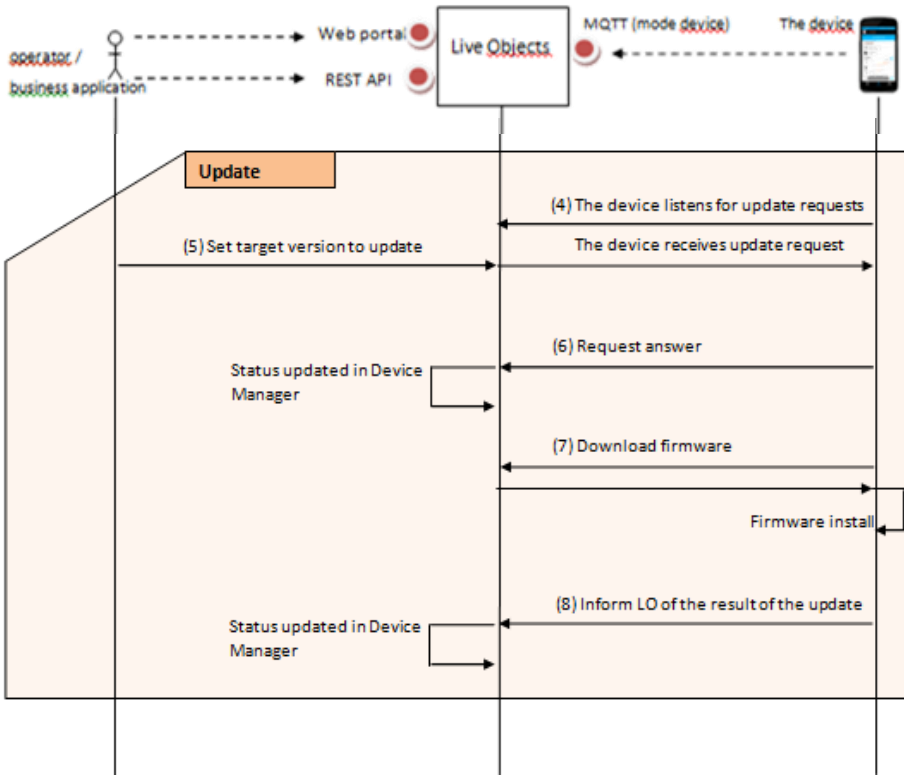

3a Create the firmware into the Live Objects Resource Manager
POST <https://liveobjects.orange-business.com/api/v0/rm>

```
{
  "resourceId": "demo_splash_screen",
  "label": "firmware of the demo",
  "description": null,
  "connector": "http-updater",
  "connectorMetadata": {}
}
```

3b Push the new firmware into the Resource Manager- define its version (1.2) : POST https://liveobjects.orange-business.com/api/v0/rm/demo_splash_screen/version

```
{
  "file": "ivBORw0KGgoAAAANSUHEUgAAAMgAAAEJCAyAAADRm2g7AAAABGdBtUEAALGPC/xhBQAAACBjSFJNAAB6JgAAGIQAAAPoAAACA6AAADTAAAOpgAAA6mAAAF3CculE8AAAAEmJLR0QA/wD/AP+....",
  "checksum": "9WeAuNLX/WaappCx4sSMYO==",
  "description": "version 1.2",
  "compatibleVersions": [],
  "resourceVersionId": "v1.2"
}
```

MQTT: firmware management : upgrade using API

4

The device listens for update requests : it subscribes to MQTT topic dev/rsc/upd, waiting for update request

5

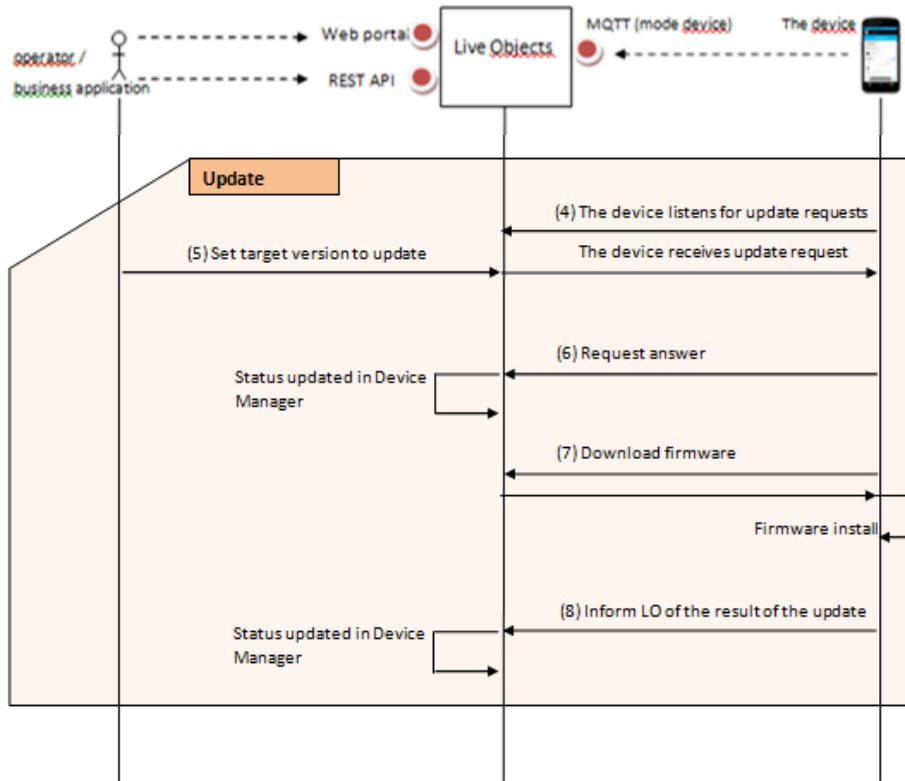

Define a transition from older to the new firmware
PUT https://liveobjects.orange-business.com/api/v0/rm/asset/android/357099070479549/resource/demo_splash_screen/targetversion

```
{  
  "targetVersion": "v1.2"  
}
```

The Device receives this message on dev/rsc/upd

```
{  
  "id": "demo_splash_screen",  
  "old": "v1.0",  
  "new": "v1.2",  
  "m": {  
    "uri": "http://.../firmware/1.2.bin",  
    "md5": "098f6bcd4621d373cade4e832627b4f6"  
  },  
  "cid": 3378454  
}
```

MQTT: firmware management : upgrade using API

6

The device answers that it accepts to download the new firmware by publishing on dev/rsc/upd/res

```
{  
  "res": "OK",  
  "cid": 3378454  
}
```

7

The device downloads the firmware from the URI given on step 5 (within 24h)
The device check the firmware, installs it

8

Inform Live Objects of the result of the update by publishing its new version on dev/rsc

```
{  
  "rsc": {  
    "demo_splash_screen": {  
      "x": "1.2"  
    }  
  }  
}
```

Add a firmware update

Launch ASAP =>
The status will be "Running"

To build a solution

- LwM2M interface for plug & play devices
- No need to develop or adapt a firmware to a specific cloud
- You can change a device model with no extra development
- You can change among LwM2M servers with no firmware development

To deploy device fleet

- “0 touch” provisioning with LwM2M Bootstrap (available end of 2022)

To run a solution

- Act on devices remotely
- Commands are clear (no hexadecimal command to find)
- Firmware update over the air
- Configure triggers to send a data or not

Live Objects specific support:

Through internet or mutualized APN : CoAP over TLS 1.2, with mandatory PSK
A private APN is required to use NO_SEC. Please contact our support if you want to use no_sec.

Any IP network, including LTE-M and NB-IoT, ready for 5G
LwM2M 1.0 and 1.1 compatibility, see the developer guide for the supported features

8	Validity (MCC, MNC)	R W		-	-

CoAP / LwM2M

Device twin: business object

Refer to detailed information and demos on YouTube:
<https://youtu.be/-DImF70aKLQ>

The screenshot shows a web interface for a device twin. On the left is a navigation menu with the following items: Identity, Data messages, LwM2M operations, LwM2M Device Twin (selected), LwM2M Server /1 (1), Device /3 (1), Connectivity Monitoring /4 (1), Firmware Update /5 (1), Location /6 (1), Generic Sensor /3300 (1), Temperature /3303 (1), Humidity /3304 (1), **Light Control /3311 (1)** (highlighted), Accelerometer /3313 (1), Pressure /3323 (1), Colour /3335 (2), Buzzer /3338 (1), and Push button /3347 (1). The main content area is titled 'Light Control' and shows 'Instance 0' with a refresh button and a read button 'R'. Below this is a table of business objects:

ID	Name	Quick operation	Observations	Value	Value timestamp
5701 ▶	Sensor Units	<input type="button" value="R"/>			05/19/2022 3:59:20 PM
5750 ▶	Application Type	<input type="button" value="R"/> <input type="button" value="W"/>		RGB PWM LED controller	05/19/2022 3:59:20 PM
5850 ▶	On/Off	<input type="button" value="R"/> <input type="button" value="W"/>		false	05/19/2022 3:59:20 PM
5706 ▶	Colour	<input type="button" value="R"/> <input type="button" value="W"/>		0xFFFFFFFF	05/19/2022 3:59:20 PM
5851 ▶	Dimmer	<input type="button" value="R"/> <input type="button" value="W"/>		100	05/19/2022 3:59:20 PM
5852 ▶	On time	<input type="button" value="R"/> <input type="button" value="W"/>		0	05/19/2022 3:59:20 PM
5820 ▶	Power factor	<input type="button" value="R"/>		0.0	05/19/2022 3:59:20 PM
5805 ▶	Cumulative active power	<input type="button" value="R"/>		0.0	05/19/2022 3:59:20 PM

The screenshot shows a web interface for LwM2M Device Twin. The breadcrumb navigation at the top reads: **Devices** > **LwM2M** > urn:ns:imei:3527530917... > **LwM2M Device Twin**. On the left, a sidebar menu lists various monitoring and management options, with 'LwM2M Device Twin' selected and expanded. The main content area displays the object URI 'urn:oma:lwm2m:x:26241' and a large heading 'Unknown object'. Below the heading, a message states: 'This object has no definition configured in Live Objects. To add one click on Add object definition below.' Two buttons are present: an orange 'Add object definition' button and a white 'See documentation' button with a black border. A tooltip is visible over the selected object in the sidebar, containing the text: 'This object (urn:oma:lwm2m:x:26241) is unknown to Live Objects, please add an object definition.'

CoAP / LwM2M

Device twin: custom objects

Refer to detailed information
and demos on YouTube:
<https://youtu.be/-DImF70aKLQ>

The screenshot shows the 'Live Objects' interface in the Orange software. The navigation bar includes 'Dashboard', 'Devices', 'Data', 'Alarms & reports', and 'Administration'. The current view is 'Data > LwM2M Twin Data config > Custom object definitions'. A sidebar on the left lists various object types, with 'LwM2M Twin Data config' selected. The main area has two tabs: 'Twin data rule' and 'Custom object definitions'. A grey box contains instructions: 'You can import custom object definitions or replace existing ones through file upload. Custom objects must have an ID >= 26241. File must be an XML in OMA format.' Below this, there is a table of 20 object definitions with a '+ Import object definition' button and a trash icon.

<input type="checkbox"/>	Name	ID	Description

CoAP / LwM2M

SenML: get batch values

Refer to detailed information
and demos on YouTube:
<https://youtu.be/-DImF70aKLQ>

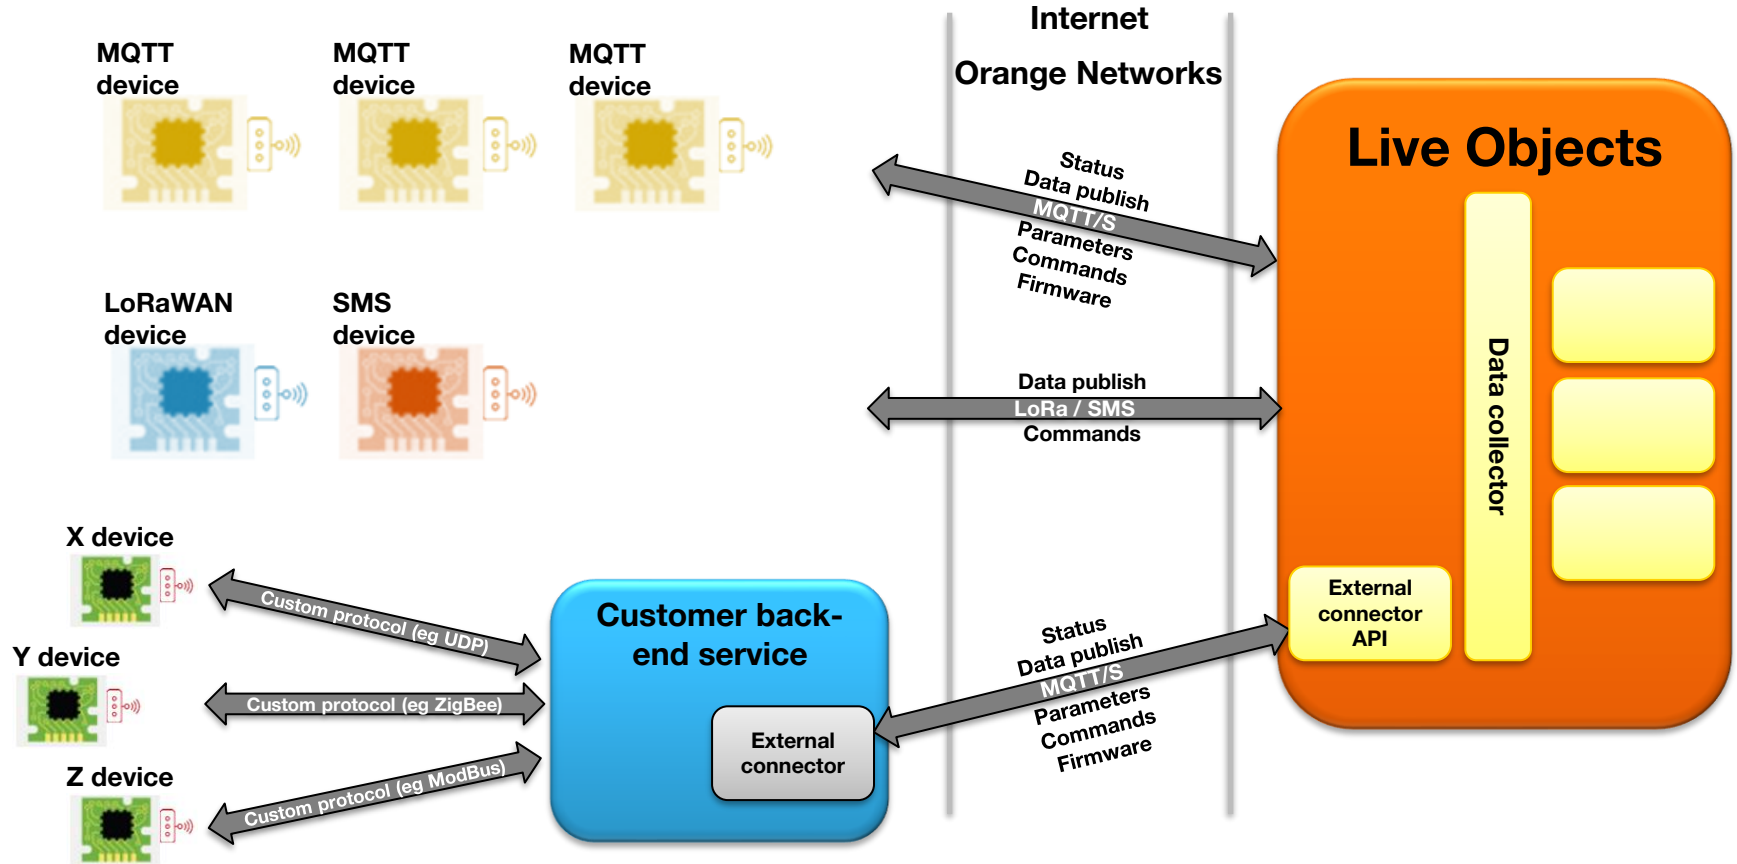

If a LwM2M device sends data using **SenML format** (JSON/CBOR), each timestamp in the SenML will generate a DataMessage.

The screenshot shows the 'Live Objects' web interface. The top navigation bar includes 'Dashboard', 'Devices', 'Data', 'Alarms & reports', and 'Administration'. The breadcrumb trail is 'Devices > LwM2M > urn:lo:nsid:imei:3527530917... > Activity logs'. A left sidebar contains navigation options: Monitoring, Identity, Data messages, Logs, LwM2M operations, LwM2M observations, and LwM2M Device Twin (expanded to show LwM2M Server /1, LwM2M Access Control /2, Device /3, Connectivity Monitoring /4, and Firmware Update /5). The main content area is titled 'Advantech' and shows a device ID '91716363'. A callout box explains: 'Activating debug mode will log at Info level all the LwM2M messages received from and sent to the device with this interface. Error logs are always logged in the log, even if debug mode is deactivated.' Below this is an 'Activate debug mode' button with a help icon. A date and time filter is set from '01/23/2023 00:00:00' to '01/30/2023 23:59:59'. A search bar contains the text 'Enter your search or select a filter below'. Filter buttons for 'Description', 'Level', and 'Type' are visible. The view is filtered by 'LwM2M Endpoint Name = urn:imei:352753091716363'. A table displays the log entries:

Date	Level	Description	Detailed description
01/30/2023 9:36:59 AM	ERROR	Instantiated objects registration is partially done with ...	Errors are : - object definition not found
01/30/2023 8:54:55 AM	ERROR	Instantiated objects registration is partially done with ...	Errors are : - object definition not found

External connector mode – Device modes

External connector mode

(+)

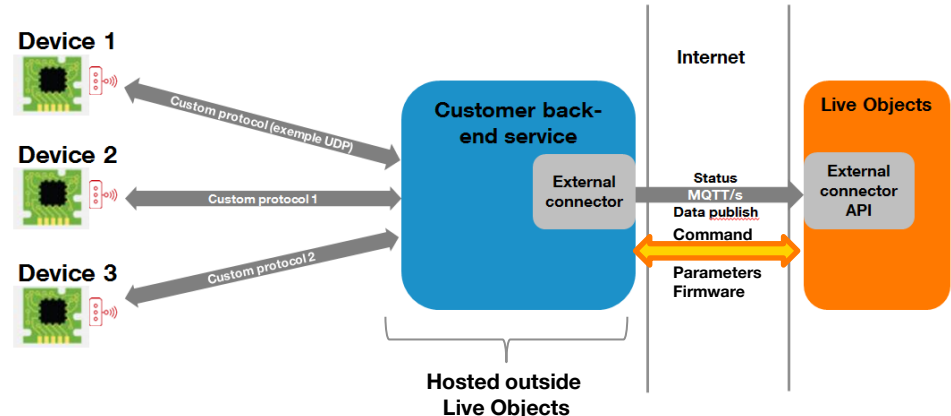

- Open to proprietary protocols (MQTT without Live Objects format, UDP....)
- Open to objects which are not able to modify their firmware

(-)

- Necessity to develop, host and run the external connector outside Live Objects.
- End to end SLA not guaranteed by Live Objects

- Follow the tutorial on <https://youtu.be/nvNhTMuTyJU>
- Use the Java SDK at <https://github.com/DatavenueLiveObjects/external-connector-SDK-LiveObjects->

Device NOT directly connected to Live Objects

- MQTT External Connector mode
- MQTT username « *connector* », API key with CONNECTOR_ACCESS role
- Manages data
- Full Device management (remote commands, configuration, firmware, decoding)

Nano/Femto gateways monitoring

The screenshot shows the 'Alarms configuration' page in the 'Live Objects' application. The breadcrumb trail is 'Alarms > Configuration > LoRa Gateway > Add rule'. The page title is 'Alarms configuration'. There are two tabs: 'Silent machine rules' and 'LoRa Gateway rule', with the latter selected. Below the tabs, there is a section 'Notifications on status change of your LoRa gateways'. Under this section, there is an 'Email N°1' configuration. The 'Recipients' section has a 'To' field with 'eric.combe@orange.com' and a 'Cc' field with 'Add an email address'. The 'Email subject' is set to 'Predefined' with a template: 'The LoRa gateway {{gatewayId}} is in {{status.current}} state.'. The 'Email body' is also set to 'Predefined' with a template: 'The state of the LoRa gateway {{gatewayId}} has changed from {{status.previous}} to {{status.current}} at {{timestamp}}.'. There is an orange '+ Email' button at the bottom left and a 'Create' button at the bottom right.

The screenshot shows an email notification in Microsoft Outlook. The subject is 'The LoRa gateway FF020693 is in OFFLINE state. - Message (HTML)'. The body of the email contains the text: 'The LoRa gateway FF020693 is in OFFLINE state.' followed by a 'Répondre' button. Below this, there is a list of recipients: 'no-reply@liveobjects.orange.com', 'COMBE Eric INNOV/M-D', and 'DELAIN Marc INNOV/M-D'. The email body also contains the text: 'The state of the LoRa gateway FF020693 has changed from ONLINE to OFFLINE at 2022-02-02T14:49:52.349Z.'

SIM-Card link with Orange M2M Portal

The screenshot displays the Orange M2M Portal interface. At the top, there is a navigation bar with tabs for Dashboard, Devices, Data, Alarms & reports, and Administration. The current page is 'Monitoring' for a specific device, 'Advantech WISE-4471'. The left sidebar contains a menu with options like Monitoring, Identity, Data messages, Logs, LwM2M operations, LwM2M observations, and LwM2M Device Twin. The main content area shows the device's status as 'Online' and provides details for its associated SIM card, including status (Activated), ICCID, SIM Card ID, MSISDN, and detected device IMEI. A 'Manage on M2M Portal' button is highlighted at the bottom of the SIM card details section.

#6 Data management

Data management

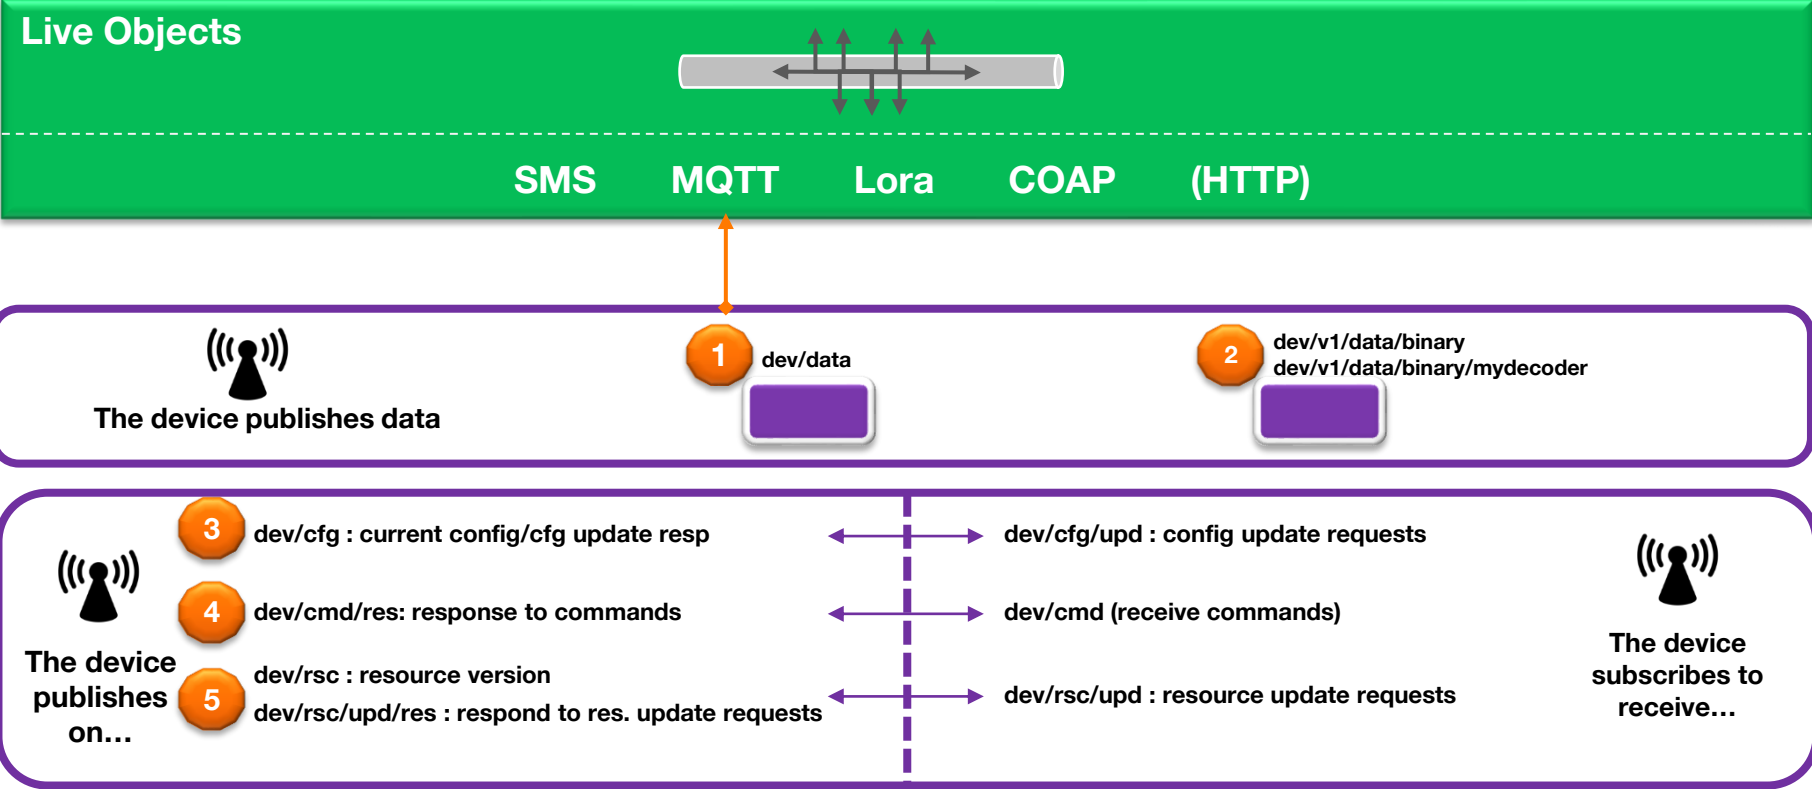

Available tools

	FIFO	Retrieve my data in a business application using MQTT or Rest via queues (FIFO)
	Decoders	Create or use decoders to structure and index object data
	Custom Pipelines	Use external webservices to enrich or prepare your data
	Data management	Perform Complex Queries (BI) on my indexed data with Elastic Search
	Event/state processing	Create rules for triggering alerts on object data sent to the business application
	Notifications & Event to Action	Live Objects or the business application can send SMS, email or push Http notifications following an event
	Silent devices	Create alarms on unexpected device behavior

#6.1

Data management
Decoders and queues

MQTT Device publishing topics

Connecting Sigfox to Live Objects

For organizations already having deployed Sigfox devices

Add a component synchronizing data and devices between Sigfox and Live Objects Platform:

<https://github.com/DatavenueLiveObjects/Sigfox-Live-Objects-connector>

Data enrichment

Data messages sent by devices are automatically enriched with device management data:

- ✓ Device group
- ✓ Device tags
- ✓ Device properties
- ✓ Connector name
- ✓ Device id
- ✓ Default data stream id

```
{
  "value":{
    "temp":12
  }
  "tags": [
    "tagPayload","tagdevice1"
  ]
}
```

Metadata enrichment

Payload sent by the device to Live Objects
MQTT device mode
Publish on dev/data

Message stored in Live Objects

```

3 kinds of decoders available

Binary

- Bit per bit decoding

- Depending on the device behavior
- For devices with fixed payload
- Customers can develop their own decoder

CSV

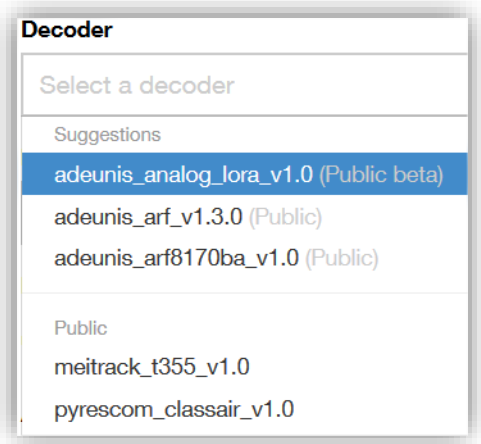

- Text-based decoding

JavaScript

- For devices with complex behavior
- For devices with variable or packed payloads
- JS decoders must be qualified by Live Objects team

Javascript Decoders

Private	Public Beta	Public
<ul style="list-style-type: none">Developed by a customer	<ul style="list-style-type: none">Developed by Orange	
<ul style="list-style-type: none">Only available for the customer	<ul style="list-style-type: none">Available for all customers (all countries, all vendors)	
<ul style="list-style-type: none">In charge of maintenance and completeness: the customer	<ul style="list-style-type: none">In charge of maintenance and completeness: no-one, no warranty of completeness	<ul style="list-style-type: none">In charge of maintenance and completeness: Orange

public/beta JavaScript decoders

Documentation : https://liveobjects.orange-business.com/doc/decoders/decoder_outputs_with_example.html

The screenshot shows the 'Identity' configuration page for a device. The left sidebar contains navigation options: Status, Identity, Uplink, and Downlink. The main content area shows the device name 'Starter Kit Franck' and its profile 'StarterKIT'. A dropdown menu for the 'Decoder' field is open, showing a search for 'TestFranckCsv1' and a list of public decoders: sensinglabs_senlabs_v1.0, ercogener_eg1114_v1.0, meitrack_t355_v1.0, ascoel_ir868lr_v1.0, and adeunis_arf8180ba_v1.0. Other fields include 'Device address' (1EF3FABD) and 'Activation mode' (OverTheAir).

Since mid-2021, decoders can split a single device frame into several business frames

To get the list of available decoders, go to the menu « Data > Decoders » in your Live Objects portal

The screenshot shows the 'Decoders' menu in the Live Objects portal. The left sidebar contains navigation options: Messages, Kibana, FIFO, Routing, Decoders, and Activity Logs. The main content area shows a list of decoders with columns for Name, Visibility, Type, Model, and State. The list includes several predefined script decoders, some of which are public or public beta.

Name	Visibility	Type	Model	State
abeeway_microtracker_v1.0	Public	Predefined (Script)	model_abeeway_microtracker_v1	Enabled
abeeway_tracker_v1.2	Public	Predefined (Script)	model_abeeway_mastertracker_v5	Enabled
abeeway_tracker_v1.3	Public	Predefined (Script)	model_abeeway_mastertracker_v5	Enabled
adeunis_analog_lora_v1.0	Public beta	Predefined (Script)	model_adeunis_analog_v0	Enabled
adeunis_arf_v1.3.0	Public	Predefined (Script)	model_adeunis_arf_v13	Enabled

private JavaScript decoders

How to proceed ?

- You can download our IDE in order for you to develop & test your decoder

Go to

<https://github.com/DatavenueLiveObjects/Payload-decoders>

- Or, you can use the code generator on <https://codegenerator-lopayloadtest.noprod-b.kmt.orange.com>

- Test your decoder on <https://codegenerator-lopayloadtest.noprod-b.kmt.orange.com/tester>

- When you are ready, contact us at liveobjects.support@orange.com in order to provision it as a private decoder on your account.

- If your live test on Live Objects is OK, then give us the go to turn your decoder to a « public » one.

186 Orange internal

Overall process

what	Create the javascript and check the decoded results locally	Check the javascript code and test it on the Live Objects platform	Create the JS decoder in Live Objects	End-to-end decoding with a "real" device
who	Partner	Live Objects team	Live Objects team	Partner
platform	Developer desktop with Eclipse/IntelliJ +java+Maven	Live Objects PREPROD	Live Objects PROD	Live Objects PROD
input	<ul style="list-style-type: none">- documentation with payload examples including decoded payload- JS decoder test framework- output format for the decoded data (json)	<ul style="list-style-type: none">- documentation with payload examples- the javascript code- a test payload- java Unit test classes- annotated java output pojos (optional, for documentation)- device hardware and firmware version	<ul style="list-style-type: none">- the javascript code- decoder name- model name (optional)- the target tenant Id (for private decoders)	<ul style="list-style-type: none">- access to Live Objects- provisioned device- decoder name
output	<ul style="list-style-type: none">- the javascript code- a test payload- the java Unit test class	GO/No GO for provisioning in production	Provisioning info to partner	Test result to Live Objects team

private decoders : binary

Example based on a 3 Bytes payload : 38AAFF
to be structured into 4 fields

described as

bit:3 test3; } 1st byte: *test3* coded on 3 bits (LSb)
bit:5 test5; } 1st byte: *test5* coded on 5 bits (MSb)
byte pressure; } 2nd byte
byte temperature; } 3rd byte

and to be presented following this template

```
{  
  "networkStat":{{test3}},  
  "batStat":{{test5}},  
  "pressure": "{{#math}}{{pressure}}+100{{/math}} Pa",  
  "temperature" : "{{#math}}{{temperature}}/10{{/math}} celsius"  
}
```

<https://github.com/raydac/java-binary-block-parser>

Add a decoder

  "long": 114.063034  
}
```

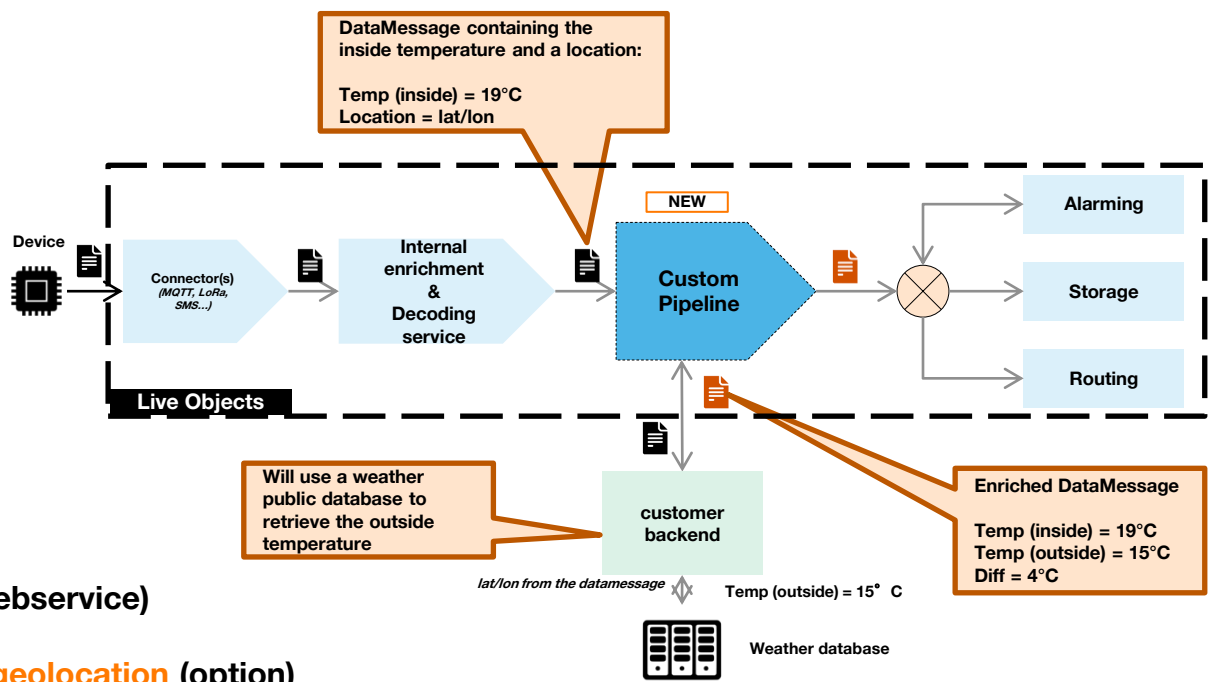

JavaScript public or private decoders with MQTT

A device using MQTT can push encoded data to Live Objects:
2 topics:

- ✓ **dev/v1/data/binary**
 - ⇒ to push raw data directly in the datazone
 - ⇒ or to use the decoder set in the device configuration
- ✓ **dev/v1/data/binary/{decoderName}** => used to link the device with a decoder already provisioned in Live Objects, data will be decoded

The data is enriched with enricher feature and a streamId is set.
The data is stored in the datazone.

Custom Pipelines

Uses:

- ✓ decoding
- ✓ deciphering
- ✓ add external data (eg, from a webservice)
- ✓ heavy computation
- ✓ cellular (Orange + OpenCellID) geolocation (option)

Priorities:

- ✓ several steps per pipeline
- ✓ at most one pipeline can handle a Data Message
- ✓ lowest priority level pipeline will be selected

■ Follow the tutorial on <https://youtu.be/rpqjJiu0H3A>

Custom Pipelines on portal

The screenshot shows the Orange Data Mining portal interface. The top navigation bar includes 'Dashboard', 'Devices', 'Data', 'Alarms', and 'Administration'. The user is logged in as 'TrainingMa...'. The main content area is titled 'Live Objects' and shows the 'Data > Custom pipelines' section. A sidebar on the left lists various object types: Messages, Kibana, FIFO, Routing, Custom pipelines (selected), Decoders, and Logs. The main panel displays the configuration for 'Custom pipelines - Data external decoding and enrichment'. It includes a 'Change status and priority' button and a '+ Add a pipeline' button. A grey box contains the following instructions:

- If a decoder is configured on the device sending the data, the data will be decoded before being processed by one of the pipeline below.
- If data messages match the filters of more than one pipeline, the active pipeline that has more Priority will be selected. For instance a pipeline with Priority = 10 will be preferred over another pipeline with Priority = 20.
- If the transformation service called by the step is unavailable, messages will bypass this step and won't be lost.

For more information on custom pipelines, [see documentation](#).

1. Pipeline identity 2. Data message filter 3. Pipeline steps

Add one or more processing steps

Cellular geolocation enrichment N°1  Reorder :  

If your devices are connected to a cellular network, you can resolve their geographical coordinates. For this, the data messages they send must contain cellular information (list of cell identifiers seen by the device, signal strength, etc.). Please refer to the [developer guide](#) for more information.

Triggering conditions

Only if "location" is null or empty in the data message

Always 

Override "location" field 

Always

Only if "location" is null or empty

Never

+ Cellular geolocation enrichment + External transformation

Application modes

Applications consume data:

- ✓ in data history (time-series) with REST APIs:
- ✓ from streams
- ✓ with Elastic Search
- ✓ from FIFOs in real time with MQTT "application" mode (including connectors to clouds)
- ✓ received from HTTP-Push or Azure-Push

BTW, applications can also produce data (not linked to a device):

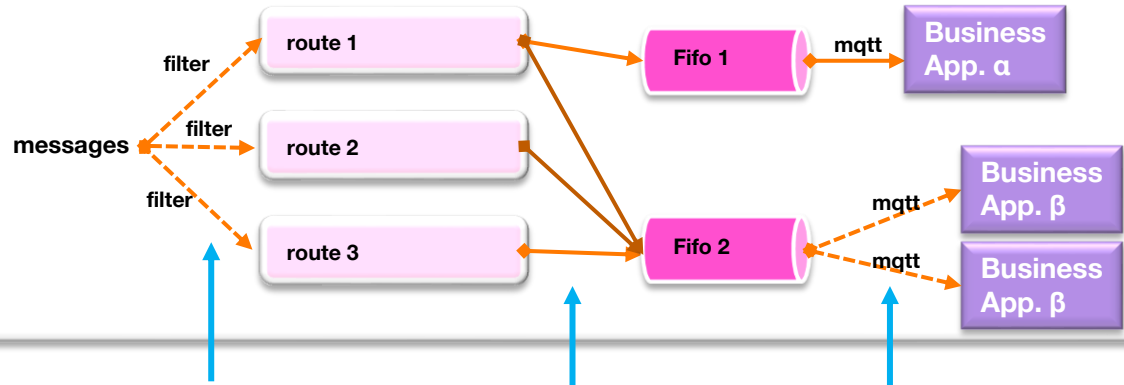

- ✓ with REST APIs:
 - ✓ stream writing (eg. deviceIdentifier, or deviceIdentifier-typeOfData)
 - ✓ bulk import
- ✓ "application" mode in MQTT, on topic application/v1/data

It makes use of decoding, pipelines, etc (if "value.payload" and "metadata.encoding" are included)

Message queues : FiFo

Benefit : it guarantees that the messages are delivered to the Application. Messages are stored in a queue on disk until consumed and acknowledged (7 days max)

- 1) Create the Fifo
- 2) Create links between data and the FiFo

Messages are replicated to all routes (with respect to filters) and all routed-to Fifos

Messages are shared among consumers of a single Fifo (random distribution)

Create a Fifo queue

The screenshot shows the Orange3 interface with the 'FIFO queues' configuration page. A modal window titled 'New FIFO messages queue' is open, allowing the user to create a new queue. The modal includes the following fields and options:

- Name ***: A text input field with the placeholder 'Enter the FIFO name'.
- Retention**: Radio buttons for 'Yes' (selected) and 'No'.
- Size (bytes) ***: A text input field with the placeholder 'Enter the storage capacity of the queue'.
- Max messages retention duration ***: A text input field with the value '7' and a dropdown menu set to 'Days'.

Below the input fields, there is a note: 'The minimum size of a FIFO is 524288 bytes. The total available storage capacity for all FIFOs is 52428800 bytes.'

At the bottom of the modal, there are 'Cancel' and 'Register' buttons. A blue box highlights the '+ Add' button in the top right corner of the modal, with an arrow pointing to it from the right side of the screen.

Feed the Fifo queue by a routing rule

Previous

Complete

Restrict an API key to access only one Fifo queue

Goal : Provide 3rd parties with an API Key that has restricted access

The screenshot shows the 'testflg' API key configuration page in the Orange interface. The left sidebar contains navigation options: Account, Users, Api keys (selected), Message bus, Firmwares, and Decoders. The main content area displays the key's details:

- Name:** testflg
- Status:** Enabled
- Description:** Child of MasterKey
- Value:** The api key value is hidden for security reasons
- Creation:** 04/25/2018 10:42:13 AM (2 months ago)
- Last activity:** 04/25/2018 10:42:13 AM (2 months ago)
- Queues restriction:** A dropdown menu is open, showing 'testFifo' and 'testFifo2' (highlighted in blue). The input field contains the text 'enter queues to be used for restriction'.
- Valid from:** (partially visible)

At the top right of the configuration area, there are three buttons: 'Regenerate', 'Disable', and 'Delete'. The top navigation bar includes 'Dashboard', 'Devices', 'Data', 'Configuration', and 'Simulation'. The user's name 'FranckChezOrange' is visible in the top right corner.

Routing rules : HTTP-Push action

Cloud connectors

Hosted open-source code to connect Live Objects to public cloud providers

Why cloud connectors?

More reliable

Enable also device management from cloud

Works with Google GCP, AWS, Azure IoT and flexible engine

Cloud connectors

Parallel component, you have to log-in with the same Live Objects credentials

The screenshot shows the Live Objects web interface. The top navigation bar includes 'Live Objects', 'Dashboard', 'Devices', 'Data', 'Alarms & reports', and 'Administration'. A 'Data' dropdown menu is open, showing 'Connectors'. The main content area is titled 'Connectors' and features a 'Log in' button. Below the button is a diagram illustrating the data flow: 'Sigfox' and 'Kerlink' (under a 'Coming soon' label) connect to a 'Device external connector', which then connects to 'Live Objects'. 'Live Objects' connects to a 'Cloud adaptor', which in turn connects to various cloud providers: Microsoft, Amazon, Google, and Orange.

The screenshot shows the 'Connectors for Live Objects' login page. The page title is '< Back to Live Objects portal'. The main heading is 'Connectors for Live Objects' with links for 'FAQ' and 'Technical support'. Below the heading is a laptop displaying a dashboard with charts and a 'Try Offer' button. To the right of the laptop is an 'Identification' form with the following fields:

- Live Objects id**: enter your login Live Objects
- Password**: enter your password
- Sign in** button

Connecting Live Objects to Amazon AWS SQS

For organizations already running business logic on Amazon, planning to work on events from IoT devices sourced via Live Objects

Add a component receiving messages from Live Objects and pushing them into AWS :

<https://github.com/DatavenueLiveObjects/Pushing-data-to-AWS-Simple-Queue-Service-SQS>

Connecting Live Objects to Microsoft IoT Azure Event Hub / IoT Hub

2 ways:

1st: add a component receiving messages from Live Objects and pushing them into Azure

<https://github.com/DatavenueLiveObjects/Azure-Event-Hub-connector-to-install-on-Azure>

Messages and device information pushed to Azure

Commands from Azure sent to devices

Azure IoT Hub Multi tenant version available

Connecting Live Objects to Microsoft IoT Azure Event Hub / IoT Hub

2nd: HTTP-push unitary messages to Azure EventHub using **Routing Rules**

Live Objects

Data > Routing > Add a rule > Actions

1. Actions

Choose one or more actions to be performed

Forward to one or more Azure Event Hubs

+ Azure Event Hub

For a robust and scalable data collect, we strongly recommend to [contact us](#) and we will handle it for you.

2. Routing conditions

3. Name

Forward to one or more Azure Event Hubs

Azure Event Hub N°1

Connection information * Enter connection string OR enter the 4 parameters separately

Generate information from connection string

Or

Event Hubs namespace * Enter the Event Hubs namespace

Event Hub name * Enter the Event Hub name

Shared Access Key name * Enter the Shared Access Key name

Shared Access Key * Enter the Shared Access Key

Failure policy

Retry
1 attempt every 5 seconds for 1 minute, then every minute for 1 hour, then every hour for 24h.

Message body ?

The whole message

A Mustache formatted message ?

Generate information from connection string

Connection string * Enter the connection string

The connection string for Azure Event Hubs looks like:
Endpoint=sb://<FQDN>/<SharedAccessKeyName>=<KeyName>;
SharedAccessKey=<Key/Value>.EntityPath=<eventHubName>. Refer to
Azure documentation to get your connection string.

! We recommend that you use the connection string of
your Event Hub instance if you want to restrict the
rights to this instance.

#6.3

Data management
Rules

Event rules

3 event types :

Simple Event Processing

- **To trigger on values or metadata**
- **Cut in 3 steps:**
 - detection of a triggering value : matching rule
 - rule that defines the event triggering : firing rule
 - triggering inhibitor for interval repeats : firing guard

State Processing

- **To trigger on all state changes (based on values)**

Activity Processing

- **To trigger after a device inactivity during a given duration**

Optional action after triggering an event : Event 2 Action

Configuration via API only

Limited in number by offer

Simple Event Processing : detecting a triggering value

Create a Matching Rule

26  "name": "xx Test hygro < 20 && temp > 20"
27 }
28 }
```

Simple Event Processing : detecting a triggering value

Create a Matching Rule : the response

The screenshot shows a web browser's developer tools interface. The 'Body' tab is selected, displaying a JSON response in 'Pretty' format. The JSON object contains an ID, a name, an enabled flag, and a data predicate. The data predicate is an AND condition with two parts: a less-than comparison for 'value.hygrometry' and a greater-than comparison for 'value.temperature'. The status bar at the top right indicates 'Status: 201 Created' and 'Time: 176 ms'.

```
1 {
2   "id": "0aca54c1-674b-44c5-8da8-a96a6686d2d2",
3   "name": "xx Test hygro < 20 && temp > 20",
4   "enabled": true,
5   "dataPredicate": {
6     "and": [
7       {
8         "<": [
9           {
10            "var": "value.hygrometry"
11          },
12          20
13        ]
14      },
15      {
16        ">": [
17          {
18            "var": "value.temperature"
19          },
20          20
21        ]
22      }
23    ]
24  }
25 }
```

Simple Event Processing : detecting a triggering value

Retrieve the list of Matching Rules

The screenshot shows a REST client interface with two overlapping windows. The top window displays the 'Headers' tab for a GET request to `https://liveobjects.orange-business.com/api/v0/eventprocessing/matching-rule`. It lists two headers: `X-API-KEY` (value: `xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx`) and `Content-Type` (value: `application/json`).

The bottom window displays the 'JSON' response for the same request. The response is a JSON array containing one object with the following structure:

```
1 [
2   {
3     "id": "0aca54c1-674b-44c5-8da8-a96a6686d2d2",
4     "name": "xx Test hygro < 20 && temp > 20",
5     "enabled": true,
6     "dataPredicate": {
7       "and": [
8         {
9           "<": [
10            {
11              "var": "value.hygrometry"
12            },
13            20
14          ]
15        },
16        {
17          ">": [

Simple Event Processing : event triggering rule

Create a Firing Rule

```
POST https://liveobjects.orange-business.com/api/v0/eventprocessing/firing-rule
Authorization
Headers (2)
Body
Pre-request Script
Tests
form-data x-www-form-urlencoded raw binary JSON (application/json)
1 {
2   "name": "testFR0StreamSample02",
3   "enabled": true,
4   "matchingRuleIds": ["0aca54c1-674b-44c5-8da8-a96a6686d2d2"],
5   "aggregationKeys": ["metadata.source"],
6   "firingType": "ALWAYS"
7 }
8
```

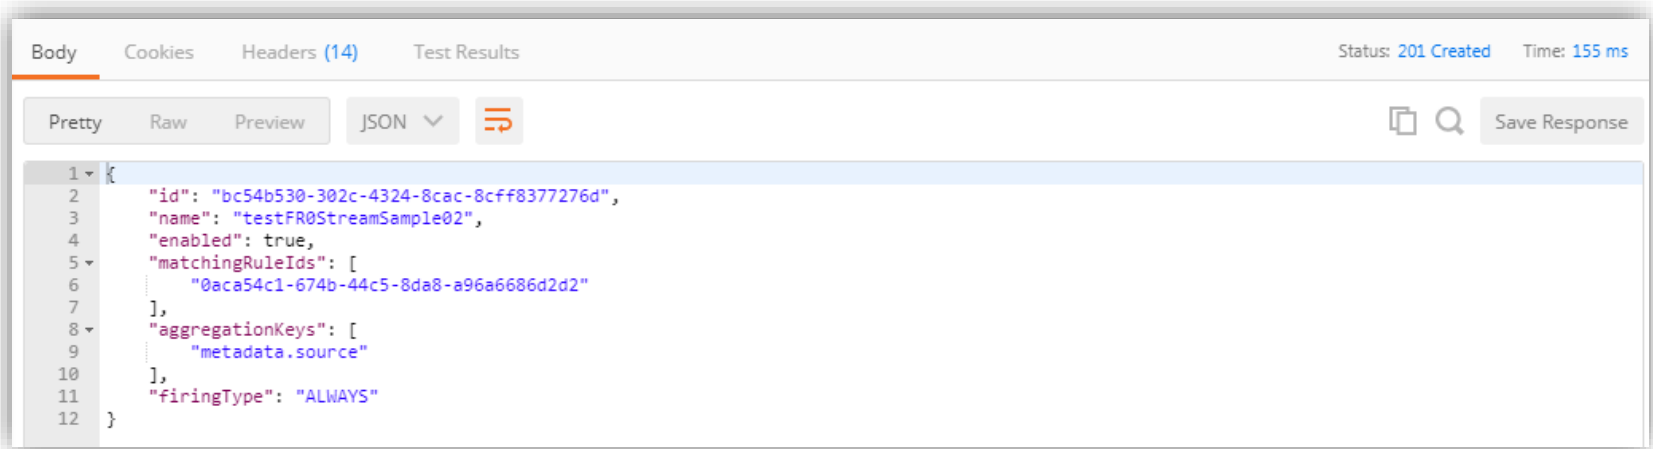

The Firing rule will trigger the events

Firing rules type = frequency function which defines when "fired events" must be generated

ONCE	Once only, the firing guard must be removed to reactivate the rule
ALWAYS	Each time the match occurs
SLEEP	Once only, then waits for the sleep duration to automatically reactivate the rule

Managing a Firing Guard : get the list of firing guards

The screenshot shows a REST client interface with the following details:

- Method: POST
- URL: `https://liveobjects.orange-business.com/api/v0/eventprocessing/firing-guard/search`
- Body type: raw (JSON)
- Body content:

```
1 {
2   "firingRuleId": "b87900ce-16f8-4b37-a723-78d23635ab10",
3   "selectionCriteria": [
4     {
5       "keyPath": "data.streamId",
6       "value": "android357329073120059"
7     }
8   ]
9 }
10 }
```

Annotations in the image:

- A pink box highlights the `"firingRuleId": "b87900ce-16f8-4b37-a723-78d23635ab10"` field, with a callout box labeled "Corresponding Firing rule Id".
- A pink box highlights the `"value": "android357329073120059"` field, with a callout box labeled "Filter on the streamId".

The event will trigger « ONCE » again

State Processing : events on all state changes

State Processing :

- **Device data are transformed to states, eg:**
 - Geo-zone ("paris-area", "london-area", ..)
 - Temperature ("hot", "cold", ..)
- **It is possible to filter the data source**
- **Switching from one state to another generates an event**
- **The event shows the old and the new states, allowing one to manage more complicated cases**

State Processing : events on all state changes

Create a rule to define states based on values or metadata

The left screenshot shows the 'Body' tab of a REST client. The JSON body is as follows:

```
1 {
2   "name": "temperature state rule",
3   "enabled": true,
4   "stateKeyPath": "streamId",
5   "stateFunction": {
6     "if": [
7       {
8         "<": [
9           {
10            "var": "value.temperature"
11          }
12        ],
13        "cold",
14        {
15          "<": [
16            {
17              "var": "value.temperature"
18            },
19            60
20          ],
21          "normal",
22          "hot"]
23        }
24      ]
25    }
26  }
27 }
```

The right screenshot shows the 'JSON' tab of the REST client. The response body is as follows:

```
1 {
2   "id": "3c6184c4-d64a-4106-8f4f-70fd5771e499",
3   "name": "temperature state rule",
4   "enabled": true,
5   "stateFunction": {
6     "if": [
7       {
8         "<": [
9           {
10            "var": "value.temperature"
11          }
12        ],
13        "cold",
14        {
15          "<": [
16            {
17              "var": "value.temperature"
18            },
19            60
20          ],
21          "normal",
22          "hot"
23        }
24      ]
25    }
26  },
27   "stateKeyPath": "streamId"
28 }
29 }
```

Set 3 temperature ranges :

- Cold : temperature is below 0 degree
- Normal : if temperature is between 0 and 60 degrees
- Hot : temperature is higher than 60 degree

StateKeyPath gives the path for the stateKey variable in the generated events

"tenantId": "5be0084791fd99693e740a2d",
"newState": "hot",
"stateKey": "android356437083184592PRIMARY",

Activity Processing : events on silent devices

Fire events if some devices don't send data (portal)

The screenshot shows the 'Alarms' section of the Orange internal web interface. The breadcrumb path is 'Alarms > Silent machine rules'. The main content area displays a table of 6 silent machine rules. The table has columns for Name, Status, Inactivity duration, Reminder every, and Source. The rules are: 'tel-seb' (Enabled, 10 minutes), 'Téléphone de Jacques' (Disabled, 1 minute), 'Téléphone Rafik 1' (Enabled, 1 minute), 'Téléphone Rafik 2' (Disabled, 10 minutes), and 'test_lora' (Enabled, 2 hours). There is also a '+ Add a silent machine rule' button and icons for refresh, play, pause, and delete.

<input type="checkbox"/>	Name	Status	Inactivity duration	Reminder every	Source
<input type="checkbox"/>	tel-seb	● Enabled	10 minutes	10 minutes	urn:lo:nsid:android:357765073221605...
<input type="checkbox"/>	Téléphone de Jacques	● Disabled	1 minute	17 days	urn:lo:nsid:android:864041035071645...

19      }
20    ]
21  }
22 }
```

Fire an event if the device has not sent data for 1½ hour, repeat it every 1½ day (ISO 8601) *minimum 10 minutes, enforced every round 10 minutes*

Monitor the following devices :

- urn:lo:nsid:android:356437083184592PRIMARY
- all the devices into the /France group and under it

Activity Processing : events on silent devices

Fire events if some devices don't send data

Activity Processing : events on silent devices

Fire events when a device becomes active again

The screenshot shows the Orange Studio interface with a 'Data' widget. The top navigation bar includes 'Dashboard', 'Devices', 'Data', 'Configuration', and 'Simulation'. The user profile 'FranckChezOrange' is visible in the top right. The 'Data' widget displays a table of 76674 answers. The table has columns for Date, Source, Stream, Value, Connector, and Tags. The data is as follows:

Date	Source	Stream	Value	Connector	Tags
06/19/2018 4:36:41 PM	urn:iosid:android:357329073120059PRIMARY	android357329073120059PRIMARY	<pre>{ "nevmin": 5491, "CO2": 517, "doorOpen": false, "hygrometry": 57, "temperature": 85, "pressure": 1034 }</pre>	matt	-

Automatic actions on events : Event to Action

Update an Action Policy : make a more complex email

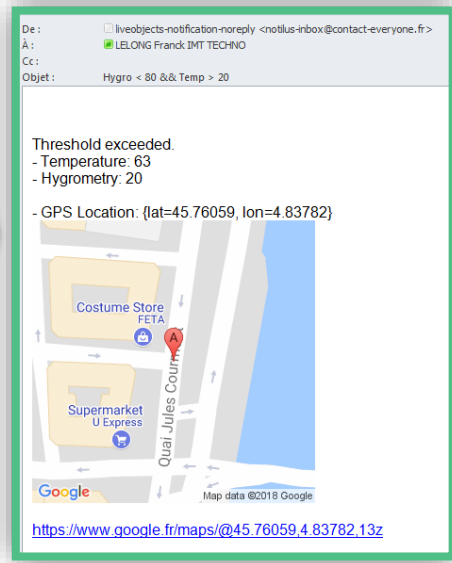

Toggle the rule activation : true/false

Change rules, receivers...The Email/SMS bodies - ex: add a Google map

```

7  "actions": {
8    "emails": [{"cc": ["franck.lelong@orange.fr"], "cci": [], "to": ["franck.lelong@orange.com"],
9    "subjectTemplate": "Hygro < 80 && Temp > 20",
10   "contentTemplate": "Threshold exceeded. <br/> - Temperature: {{matchingContext.data.value.temperature}} <br/> - Hygrometry:
    {{matchingContext.data.value.hygrometry}} <br/> <br/> - GPS Location: {{matchingContext.data.location}} <br/> <img width=\"300\"
    src=\"https://maps.googleapis.com/maps/api/staticmap?center={{matchingContext.data.location.lat}},{{matchingContext.data.location
    .lon}}&zoom=18&size=300x300&markers=color:red%7Clabel:A%7C{{matchingContext.data.location.lat}},{{matchingContext.data.location
    .lon}}\"> <br/> <p> https://www.google.fr/maps/@{{matchingContext.data.location.lat}},{{matchingContext.data.location.lon}},13z
    </p>"
11  }},

```

Automatic actions on events : Event to Action

Update an Action Policy : build a conditional text

Eg, translate a 0/1 to a user-localized string *Fermé/Ouvert*

```
"contentTemplate": "{{#matchingContext.data.location}}GPS: {{matchingContext.data.location}}, {{  
/matchingContext.data.location}}{{#matchingContext.data.value.tor1.currentState}}FERME{{  
/matchingContext.data.value.tor1.currentState}}{{^matchingContext.data.value.tor1  
.currentState}}OUVERT{{/matchingContext.data.value.tor1.currentState}}, TOR state is  
{{matchingContext.data.value.tor1}}"
```

<https://mustache.github.io/mustache.5.html>

Automatic actions on events : Event to Action

Make an HTTP Push or FIFO Publish & advanced filtering

`/api/v1/event2action/actionPolicies`

```
{
  "id": "some_user_defined_id",
  "name": "some_user_defined_policy_name",
  "enabled": true,
  "triggers": {
    "dataMessage": {
      "version": 1,
      "filter": {
        "deviceIds": ["deviceId1","deviceId2"],
        "connectors": [ "lora"],
        "groupPaths": [{
          "includeSubPath": false,
          "path": "/europe/france"
        }],
        "tags": [{"HIGH", "ALERT"}, {"PROD"}]
      }
    }
  },
  "actions": {
    "httpPush": [...],
    "fifoPublish": [...]
  }
}
```

Data management data store : APIs to store and retrieve data

Show/Hide | List Operations | Expand Operations

GET /api/v0/data/streams/{streamId} Retrieve data from the streamId

POST /api/v0/data/streams/{streamId} Insert a new Data into the stream

Data management data store : APIs to store and retrieve data

Show/Hide | List Operations | Expand Operations

GET /api/v0/data/streams/{streamId} Retrieve data from the streamId

Implementation Notes

return an array of StoredData/Message matching the request parameters.

Restricted to API keys with at least one of the following roles : DATA_R.

Response Class (Status 200)

array of StoredData/Message matching the request parameters

Model: Example Value

```
{
  "created": "2015-09-25T00:00:00.000Z",
  "tag": "testing",
  "location": {
    "accuracy": 18,
    "alt": 5.00001,
    "lat": 45.000001,
    "lon": -12.00001,
    "provider": "GPS"
  }
}
```

Response Content Type: application/json

Parameters

Parameter	Value	Description	Parameter Type	Data Type
streamId	android357329073120059	StreamId from which the data will be retrieved	path	string
limit	100	max. number of data to return, value is limited to 1000	query	integer
timeRange		Filter data where timeRange is in timeRange (must be ISO 8601 format). TimeRange [lowerbound],[upperbound]. Come is mandatory, lowerbound and upperbound are optional. lowerbound is inclusive, upperbound is exclusive.	query	Array(string)
bookmarkId		id of the last document retrieved that can be used to paginate. The result will be the one following the document id	query	string
X-API-KEY	xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx	A valid API key	header	string

2518         },
```

Percentiles show the point at which a certain percentage of observed values occur.
eg : if my tolerance is 5% of the readings, I know that my PM10 is \leq 52ppm

Percentile rank show the percentage of observed values which are below a certain value.
eg : if my threshold is 100ppm, I know that 99.73% of PM10 readings are compliant

searching with Elasticsearch, focus on the « model »

```
1 {
2   "size" : 100,
3   "query" : {
4     "bool" : {
5       "filter" : [

22            }
23          }
24        }
25      ]
26    }
27  }
```

The screenshot shows the 'Datavision' interface with a 'Live Objects' table. The table has columns for Date, Source, and Stream. A row is highlighted with a yellow background, showing a date of 27/11/2017 19:32:55, a source URL, and a stream ID. To the right, a detailed view of the object is shown, containing metadata and a 'value' field. The 'value' field contains a JSON object with 'revmin', 'temperature', and 'hygrometry' fields. A yellow box highlights the 'model' field in the object view, which is set to 'demo'. A yellow arrow points from the '@demo.value.temperature' field in the code on the left to this 'model' field.

The data field must be prefixed by @ + the « model » of the json data

- When the device sends Json data, it must put a « model » field in order to make Elastic Search (ELS) index it
- ELS starts indexing these data when it receives the first payload containing a « model »
- The device can add fields to the same « model »
- The device must not change the data type fields into the same « model » otherwise it will not be indexed.

Personalized dashboards with Widgets

- **Linked to a user**
- **Several dashboards possible per user**
- **Can be shared among users**

- **Device management : statistics on the fleet status and connectivity**

- **Values : display the last values returned by a device**

- **Curves : display line charts for a value from a list of devices (up to 10)**

- **Maps : display a map of a list of devices (up to 10) with their last value**

Important : to create a widget the selected devices must have sent data at least once.

Personalized dashboards with Widgets

Data monitoring

Value

Displaying the last value returned by a device

Line chart

Displaying variation curves of a numeric value for an equipment list

Map with value

Display of a maximum of 10 devices on a map with the last value of one of the data reported

Gauge

Displays on a gauge the last value received from a device

Histogram

Displays a histogram of numeric values for an equipment list

On/Off

Displaying information based on the value returned by a device

Statistics

Displays the minimum, maximum, average or sum for a selection of devices

Last values

Displaying the latest values of an equipment

Device monitoring

Devices by tag, property

Displays fleet or a group of devices by tags or property values

LoRa devices by profile

Displays fleet or a group of devices by LoRa profiles

LoRa devices by status

Displays fleet or a group of devices by LoRa connectivity status

Fleet Inventory

Displays fleet's inventory by group

Uplink traffic

Display a histogram of uplink messages traffic over a period

Map with devices status

Displays fleet or a group of devices on a map with the connectivity status

Personalized dashboards with Widgets

Dashboarding with Node-RED

Install and use the dashboarding module of Node-red.
In addition to display your data, you can also send commands to your devices.

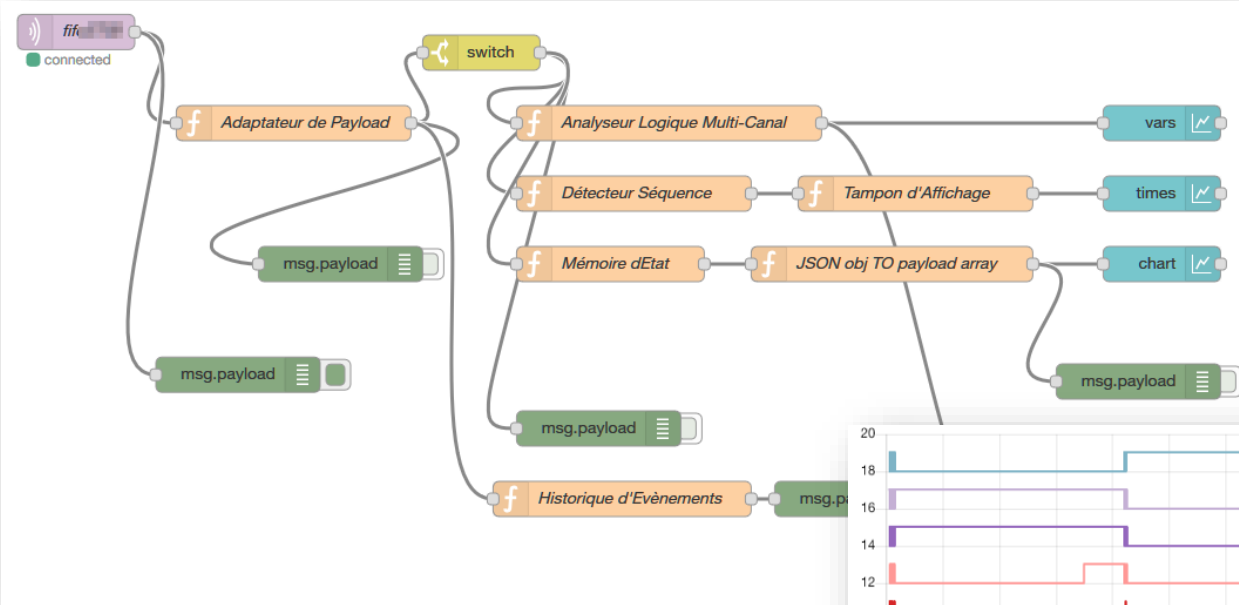

Follow our tutorial on Github

Download PDF

Node-red : example – computing a time-delta amongst frames

Node-red : graphical prototyping tool

Free tool (open source, Apache license)

PC, public-hosted, or private-hosted deployment

Dashboard needs to be activated:

On Windows to install Node-Red and dashboard module you can follow that video <https://www.youtube.com/watch?v=hEpeobDyj8k>

- go to <https://nodejs.org/en/> and install Node-RED
- on Windows, open CMD.exe as an administrator
- install Node-RED `npm install -g --unsafe-perm node-red`
- launch Node-RED `node-red`

You will find Note-RED at <http://localhost:1880>

To install dashboard module, open the menu at the top right and open "Manage palette" menu

then open "Install" tab , search "node-red-dashboard" and install it

You will find Dashboard at <http://localhost:1880/ui>

41     private static final boolean HANDLE_FIRMWARE  = false;
42     /*
43      * MSG_SRC=1: simple message built with objects
44      * MSG_SRC=2: simple message built with hash map
45      * MSG_SRC=3: raw message to be decoded by Live Objects as a float number
46      * MSG_SRC=4: raw message (image) NOT to be decoded by Live Objects
47      */
48     private static final int    MSG_SRC          = 1;
49     private static boolean LOOP                 = true;
  
```

Connect an MQTT device and send a payload

MyDevice.java

```
// Connection parameters
private static final String API_KEY           = "363e2fbcb4244fb18f5b7050e4385cb1";
private static final String CLIENT_ID       = "urn:lo:nsid:samples:device1";
private static final String STREAM        = "device1stream";
private static final String MODEL         = "devtype1";

MqttClient mqttClient = createAndConnectMqttClient(ConnectionMode.DEVICE);
System.out.println("Connected to Live Objects in Device Mode" + (SECURED ? " with TLS" : ""));
message = new SimpleMessage().getMessage(STREAM, MODEL);
topic = MQTT_TOPIC_PUBLISH_DATA;
// send your message
mqttClient.publish(topic, message);
```

Generate the API Key from the portal

Create an MQTT connection as a device
« json+device »

Build the payload

Publish the message

```
public static MqttClient createAndConnectMqttClient(ConnectionMode mode) throws MqttException {
```

```
// create and fill the connection options
MqttConnectOptions connOpts = new MqttConnectOptions();
connOpts.setCleanSession(true);
connOpts.setPassword(API_KEY.toCharArray());
String clientId;
if (mode == ConnectionMode.DEVICE) {
    connOpts.setUsername("json+device"); // needed to publish as a device
    clientId = DEVICE_URN;
} else {
    connOpts.setUsername("application"); // needed to subscribe as an application
    clientId = "RandomClientId" + new Random().nextInt();
}
connOpts.setKeepAliveInterval(30); // 30 seconds, to keep the connection with Live Objects
```

```
if (SECURED) {
    server = "ssl://liveobjects.orange-business.com:8883";
    connOpts.setSocketFactory(SSLUtils.getLiveObjectsSocketFactory());
} else {
    server = "tcp://liveobjects.orange-business.com:1883";
}
MqttClient mqttClient = new RegulatedMqttClient(server, clientId, new MemoryPersistence())
// now connect to LO
mqttClient.connect(connOpts);
return mqttClient;
```

Connect an MQTT device and send a payload

```
byte[] prepareMessage(String stream, String model) {  
    // create message  
    LoData loData = new LoData();  
  
    Date msgDt = new Date();  
    loData.s = stream;  
    loData.m = model;  
    loData.ts = toISO8601UTC(msgDt);  
    loData.loc = new Double[] {  
        48.125 + (((double) (msgDt.getTime() % 1000)) / 1000),  
        2.185 + (((double) (msgDt.getTime() % 1000)) / 1000)  
    };  
    loData.v = preparePayload(msgDt);  
    loData.t = Arrays.asList("MQTTdata", "SampleTag");  
  
    String msg = new Gson().toJson(loData);  
    System.out.println("Publishing message: " + msg);  
    return msg.getBytes();  
}
```

```
Object preparePayload(Date msgDt) {  
    SampleData myData = new SampleData();  
    myData.log = "Message from deviceMode on dev/data on " + msgDt;  
    myData.temperature = (int) (Math.pow((msgDt.getTime() % 1000) / 100, 2));  
    myData.hygrometry = (int) ((msgDt.getTime() % 1000) / 10);  
    return myData;  
}
```

Main payload definition with metadata (stream, model, timestamp, location, tags)

Actual values

```
public static class SampleData {  
    public String log;  
    public int temperature;  
    public int hygrometry;  
}
```

Connect an MQTT device and send a payload

Result on Live Objects portal

The screenshot shows the 'Live Objects' portal interface. At the top, there are navigation tabs: Dashboard, Park, Data, Configuration, and Simulation. Below this, there are input fields for Stream, Source, From, To, Tags, and Connector. A table at the bottom displays the following data:

Date	Source	Stream	Value	Connector	Tags
12/01/2017 12:06:12 PM	urn:io:nsid:sensor:SampleLO001	StreamSampleLO001	{ "revmin": 6679, "temperature": 118, "hygrometry": 22 }	mqtt	SampleLO

```

« dev/cmd »

Collect and answer a command

```
public void messageArrived(String s, MqttMessage mqttMessage) {
    // parse message as command
    LoCommand command = new Gson().fromJson(new String(mqttMessage.getPayload()), LoCommand.class);
    System.out.println("Device command received: " + new Gson().toJson(command));

    LoCommand.LoCommandResponse response = new LoCommand.LoCommandResponse(new HashMap<>(), command.cid);
    response.res.put("my-ack", "this is my command acknowledge to " + command.req);

    new Thread(() -> {
        try {

            String responseJson = new Gson().toJson(response);
            System.out.println("Publishing command acknowledge message: " + responseJson);

            MqttMessage message = new MqttMessage(responseJson.getBytes());
            message.setQos(QOS);

            mqttClient.publish(MqttTopics.MQTT_TOPIC_RESPONSE_COMMAND, message);
            System.out.println("Command ack published");

        } catch (MqttException me) {
```

Get (and apply) the remote command

```
public class LoCommand {
    public String req;           // command request
    public Map<String, Object> arg; // command parameters
    public Long cid;           // Correlation ID
```

Prepare the acknowledge

Send the acknowledge on
« dev/cmd/res »

```
public static class LoCommandResponse {
    public LoCommandResponse(Map<String, Object> res, Long cid) {

        public Map<String, Object> res; // List of answers (keys are)
        public Long cid; // Correlation ID
    }
```

Collect and answer a command

The result in the console

```
Device command received: {"req":"buzz","arg":{"out":1.0},"cid":-10101887}
Publishing command acknowledge message: {"res":{"my-ack":"this is my command acknowledge to buzz"},"cid":-10101887}
Command ack published
```
